A new question (highlighted in red below) was added by the Research Subcommittee following the question about whether the vignette describes a typical patient. This is the first time that this question has been included in an E/M survey. The statistics from this survey question are presented below for informational purposes. We do not believe, however, that any conclusion can be drawn from these data because this question was placed after the "typical patient" question and not in the context of total time on the date of encounter (ie, Question 2B). It is possible that some respondents may have interpreted this question to ask if only one physician/QHP is responsible for the typical patient on a given day, independent of the specialty. Said another way, the question does not specify whether the response should be reflective of more than one physician/QHP in a group that is reporting a single code on a date.

On a single calendar day, will there typically (ie, more than 50% of the time) be more than one physician/QHP who spends time providing CPT code <auto populate> for the typical patient described above?

	99221		99222		99223		99231		99232		99233	
Yes	83	36%	165	66%	205	80%	95	41%	179	71%	200	78%

	99234		99235		99236				99238		99239	
Yes	24	41%	38	64%	39	66%			77	46%	86	50%
No	34	59%	21	36%	20	34%			90	54%	85	50%

Supplemental Information 2: *(The 99221-99236 have this additional information for Tab 13.)*

When compared with the prior survey, additional text was added to the general background information to make it clear that: the code changes will not be effective until 2023; the codes will include both inpatient and observation services; and all time on the date of encounter is included—not just unit/floor time.

Background for Question 2 **[Revised text highlighted in red]**

Physician/other qualified health care professional time includes the following activities, when performed, whether on or off the unit/floor:

- preparing to see the patient (eg, review of tests)
- obtaining and/or reviewing separately obtained history
- performing a medically appropriate examination and/or evaluation
- counseling and educating the patient/family/caregiver
- ordering medications, tests or procedures
- referring and communicating with other health care professionals (when not separately reported)
- documenting clinical information in the electronic or other health record
- independently interpreting results (when not separately reported) and communicating results to the patient family/caregiver
- care coordination (when not separately reported)

DO NOT include time for work related to another service, procedure, or evaluation and management code that is separately reportable.

"Physician work" does not include the services provided by support staff who are employed by your practice and cannot bill separately, including registered nurses, licensed practical nurses, medical assistants, receptionists, or technicians; these services are included in the practice expense relative values, a different component of the Resource-Based Relative Value Scale (RBRVS).

When total time on the date of encounter is used to select the appropriate level of an inpatient and observation care service code, both the face-to-face and non-face-to-face time personally spent by the physician or QHP and other physicians or QHPs in the same group and same subspecialty that is reporting the single inpatient/observation consultation are summed to select the appropriate code. Please consider all the time spent on the service for a full calendar day.

"Unit/floor time" is no longer the basis of time when selecting a code level based upon time. It is total time on the date of the encounter, whether on or off the unit /floor.

Hospital Inpatient/Observation Services

Services PRIOR to work on the unit/floor ON THE DATE OF THE ENCOUNTER:
This includes services that are not performed on the patient's hospital unit or floor, including: communications with other professionals and the patient's family; obtaining and/or reviewing the results of diagnostic and other studies; and written and telephone reports.

Services ON the unit/floor ON THE DATE OF THE ENCOUNTER:
This includes the services provided while you are present on the patient's hospital unit or floor, including: reviewing the patient's chart; seeing the patient, writing orders or performing documentation, and communicating with other professionals and the patient's family.

Services AFTER work on the unit/floor ON THE DATE OF THE ENCOUNTER:
This includes services that are not provided on the patient's hospital unit or floor, including:

communicating further with other professionals and the patient's family; obtaining and/or reviewing the results of diagnostic and other studies; writing orders or performing documentation and other written or telephone reports.

- Question 2 was expanded to include Question 2A to be used as a "worksheet" for considering time based on the definitions of time. This was followed by Question 2B which automatically populated the total time based on Question 2A, requesting that the survey respondent confirm the total time was accurate (or go back and adjust times in Question 2A. Question 2B was meant to establish a total time for the revised codes as arrayed, with confirmation by the respondent prior to proceeding with the survey.

  The statistics for Question 2A are shown below—for information. There is not a way to calculate the median based on medians of subsets of the whole and still be statistically accurate. It is statistically incorrect to sum the median statistic of individual components for the same day of service and call that sum the median of total time. This is because each respondent "arranged" their day of service time based on their particular experience. In Question 2B the respondents were asked to focus on total time and confirm that total time was accurate. The goal of the survey time question was to collect total time. As comparison, it is also incorrect to sum the minimum or maximum statistic and state the sum is the minimum or maximum of total time. For example, considering code 99221, no respondent indicated 4 minutes for total time; the minimum total time for any respondent was 9 minutes.

Question 2 text revisions are highlighted in red

Question 2A

How much physician/QHP time on the date of encounter is required per patient treated for each of the following steps in patient care related to the survey code(s)? It is important to be as precise as possible. For example, indicate 3 or 6 minutes instead of rounding to 5 minutes or indicate 14 or 17 minutes instead of rounding to 15 minutes. Type in your answers (in minutes) in each box below. If no time is typically spent on a listed time period, please enter 0 minutes. It is important that you list all the time on a calendar date and, if more than one physician/QHP is performing the single service, to sum the time spent on the date.

Please refer to the definitions of physician time above.

~~IMPORTANT: Beginning in 2023, when total time on the date of encounter is used to select the appropriate level of a Inpatient or Observation Consultation Service code, both the face-to-face and non-face-to-face time personally spent by the physician and/or QHP are summed to select the appropriate code.~~

DO NOT include the time provided by clinical staff, such as RNs, LPNs, MAs and technicians, as their time is measured separately from this survey and do not include time for services that are separately reported.

	Place your time (in minutes) below
✶ Physician/QHP time on date of encounter PRIOR to work on the unit/floor (in minutes)	
Physician/QHP time on date of encounter ON the unit/floor (in minutes)	
Physician/QHP time on Date of Encounter AFTER work on the unit/floor (in minutes)	

Question 2B

Below is the TOTAL physician/QHP time you estimated that is typically performed on the date of encounter (this is the aggregate of your responses for each code in the previous question). "Unit/floor time" is no longer the basis of time when selecting a code level based upon time. It is total time on the date of the encounter, whether on or off the unit/floor. Also, these estimated times should not include time for services that are separately reported and also should NOT include the time provided by clinical staff, such as RNs, LPNs, MAs and technicians, as their time is measured separately from this survey.

CPT Code	Descriptor	TOTAL Physician/QHP time on Date of Encounter from Your Estimate
<auto populate>	<auto populate>	<auto populate>

Please confirm that the above Total Time estimates, which aggregated your responses to the previous survey question, represent the total physician/QHP time on the date of encounter that is required per patient treated for each of the following steps in patient care related to the survey code(s). If you wish to adjust any of your time estimates after reviewing the Total Time, click the BACK button below, and update your estimates as needed.

○ I confirm that I have reviewed the above Total Time estimates and they appropriately reflect the total physician/QHP time on the date of encounter.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99221 Tracking Number F1 Original Specialty Recommended RVU: **1.92**
Presented Recommended RVU: **1.92**
Global Period: XXX Current Work RVU: **1.92** RUC Recommended RVU: **1.63**

CPT Descriptor: Initial hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with an acute, uncomplicated illness or injury is admitted for either initial inpatient or observation care services.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Review available prior medical records and data, place requests for other records and data as necessary for the new patient visit/obs/admission service. Coordinate with other members of the health care team regarding the obs/admission service. Visit patient location (e.g., floor, observation area, unit) confirm patient's identity. Review the medical history with the patient and/or family/caregiver. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan (requiring straightforward or low medical decision making [MDM]). Consider discharge needs of patient. Discuss the treatment plan with patient and family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write and/or review observation or inpatient admission orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Document the encounters throughout the calendar day in the medical record. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family and/or caregivers throughout the calendar day. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver that may occur within the calendar day and respond to treatment failures.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	6%	30%	61%	3%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	31%	62%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	71%	25%
Physical effort required	7%	54%	39%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	32%	63%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	15%	33%	52%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	15%	45%	40%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	15%	64%	21%
Physical effort required	15%	36%	49%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	12%	30%	58%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In February 2021, the CPT Editorial Panel deleted seven observation care codes and revised eleven codes to merge inpatient and observation care and to align with the principles included in the office or other outpatient E/M services (99202-99215) by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visit codes, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of an inpatient hospital or observation care visit code, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing and managing the patient are summed to select the appropriate code. The inpatient and observation care services were surveyed for the October 2021 RUC meeting. The survey time captured the total time on the date of encounter by calendar date. All the codes were surveyed in June/July and discussed at length for the October 2021 RUC meeting as well as several pre facilitation meetings.

In October 2021, the RUC referred these services to be resurveyed because the survey did not include a request for distinct time before and after floor/unit time, therefore could not be compared to previous RUC surveys of these services.

The Inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) were surveyed again by the specialty societies with the research approved revised survey tool. The survey societies sent out the survey randomly to members in November 2021 for presentation at the January 2022 RUC meeting.

The surveying societies were:
American Academy of Hospice and Palliative Medicine
American Academy of Neurology
American Association of Neurological Surgeons/Congress of Neurological Surgeons
American Academy of Orthopaedic Surgeons
American Academy of Pediatrics
American Association for Thoracic Surgery
American College of Cardiology
American College of Chest Physicians
American College of Obstetricians and Gynecologists
American College of Physicians
American College of Surgeons
American Geriatrics Society
American Nurses Association
American Society of Clinical Oncology
American Society of Colon and Rectal Surgeons
American Society for Surgery of the Hand
American Thoracic Society
Infectious Diseases Society of America
North American Spine Society
Society of Hospital Medicine
Society of Thoracic Surgeons
Society for Vascular Surgery

Details of the Research Approved Revised Survey Tool for inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) at the January 2021 RUC meeting

As discussed at the October 2021 RUC meeting, the specialty societies believed that the intraservice time data was flawed. The societies believed that some respondents may have only been considering floor/unit time and not the time before or after floor/unit time on the date of encounter. The RUC agreed with the specialty societies to resurvey the inpatient and observation E/M services, after revision of the survey tool to include definitions of time before and after floor/unit time. This would allow better comparison to prior surveys that included these time components. It should be noted that although the revised survey tool included a worksheet question asking for separate on/off floor times on the date of service, this question was followed by a question that included the summed total time for respondent confirmation that the total time was accurate. If the respondent did not agree with the total time for one or more of the codes as arrayed, then the respondent was asked to return to the worksheet question and adjust the times as needed. The respondent could not move forward in the survey before affirming that the total

times on the date of encounter were accurate. This total time confirmation is important because the joint societies believe the correct analysis is to use the total time as confirmed by the survey respondent. Both survey tools are included in the RUC materials. We note that the total time presented in our SoRs and in our RUC summary materials are the statistics of the total time as calculated in the survey tool and verified by the survey respondent. For full transparency, additional details on the survey tool questions and responses is provided in a separate informational file.

Compelling Evidence

We believe we meet several compelling evidence criteria

1.) Documentation by "Other reliable data" for change in physician work
   a. *Change in patient population*
   b. *Change in length of hospital stay*
   c. *Change in Technology*
   d. *Change in Knowledge (new provider type)*

Documentation by Other reliable data

Our compelling evidence is based on four types of changes: a.) patient population; b.) reduced length of stay; c.) change in technology (inpatient EHRs); and d.) change in knowledge (new provider type). We believe each of these meet the criteria for "***other reliable data.***"

Change in patient population

The number of diagnoses that appear in the Medicare claims for Inpatient Visits (based on the 5% file) has increased over the years since these codes were last reviewed. The largest changes are occurring at the higher-level services. Since 2006 the number of diagnoses has increased by more than 30% for all the codes except 99221 and 99222 which have gone up 25%. For example, for 99223 the number has increased by 31% and for 99233, the increase is 41%.

Our experts are experiencing more complicated patients, with more clinical indications to review and consider, while balancing moving these more complicated patients to the next setting of care, such as a SNF. The chart below supports the fact that patients at higher level codes have more indications to consider in decision making and physicians/QHP caring for these patients are being asked to move those patients along to the next level of care and shorter LOS.

CPT Code	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	Percentage Change

The demographics of hospitalized patients continue to change over time, particularly as payors and patients apply pressure to provide care in the lowest, safest acuity setting. Medicare and Medicaid patients continue to grow as a proportion of inpatient stays. In 1999, Medicare patients made up 35.9% of inpatients and Medicaid patients, 16.6%. By 2018, these proportions increased significantly: Medicare (40.9%) and Medicaid (22.7%).[1] This shift was almost entirely accounted for by decrease in

[1] Agency for Healthcare Research and Quality (AHRQ). HCUP Fast Stats—Trends in Inpatient Stays. Accessed November 29, 2021, via https://www.hcup-us.ahrq.gov/faststats/NationalTrendsServlet/

inpatients with private insurance, while overall number of hospitalizations nationwide remained relatively constant. Over the same 1999-2018 period, average length of stay for Medicare patients declined from 6.0 days to 5.2 days and Medicaid patients stayed similar (4.5 days to 4.6 days).[2]

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

Change in length of hospital stay

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

In addition, a published report from the OIG has documented significant decreases in length of stay and that hospitals are billing the highest severity DRGs more frequently.

The OIG stated:
"Hospitals are increasingly billing for inpatient stays at the highest severity level, which is the most expensive one. The number of stays at the highest severity level increased almost 20 percent from FY 2014 through FY 2019, ultimately accounting for nearly half of all Medicare spending on inpatient hospital stays. The number of stays billed at each of the other severity levels decreased. At the same time, the average length of stay decreased for stays at the highest severity level, while the average length of all stays remained largely the same."

While this OIG article suggests that providers may be upcoding, the expert panels' experience suggest that the trend supports the fact that physicians/QHPs are caring for patients who have many more contributing conditions and increased pressure to get the patient on to the next level of care outside the acute care setting of the inpatient stay. This requires more intense and complex work in a shorter period of time.

Change in Technology

Outpatient EHRs are significantly different from inpatient EHRs. Some of the most obvious differences are requirements for pharmacy potential interactions to be overridden by the physician, as necessary. Additionally, flags are frequently popping up as they are put in place for safety reasons, however, these flags require physician/QHP rather than clinical staff to review and override after decisions for treatments have been modified and thus requires the physician/QHP to go back to the EHR before the clinical staff can continue with care of the patient such as a medication change.

The American Hospital Association reported that in 2017[3] 95% of hospitals had some form of EHR implemented. This is significant change from 2006. As reported in 2006 by the Healthcare Financial Management Association, only 13% of hospitals had an EHR for health outcomes; 13% for clinical decision support; and 2% for patient access.

---

Data from the Chronic Conditions Data Warehouse also support our assertion that Medicare patients have increasing rates of comorbidities that in turn increase the complexity of hospitalizations. In addition to high prevalence of diabetes, hypertension and COPD among Medicare beneficiaries, there has been marked increase between 2010 and 2019 in rates of chronic kidney disease (15% to 26%), depression (14% to 19%) and rheumatoid arthritis/osteoarthritis (29% to 35%).

Change in Knowledge (new HOSPITALIST specialty provider type)

Hospitalists are a new specialty that was not fully organized as a specialty in 2006 when the codes were last surveyed and is a specialty that continues to grow. The term "hospitalist" was coined in 1996 to describe a trend of primary care physicians choosing to practice exclusively in the hospital[4] and the field began to organize in earnest in the early 2000s. Hospitalists are predominantly internal medicine trained, but there are also a significant number of hospitalists with the specialties of family medicine, pediatrics, and medical subspecialties. In 2011, there were 25,787 adult hospitalists identified using a 90% threshold of Medicare billing claims associated with hospitalizations.[5] In 2012, there were 28,473 hospitalists identified using a nearly identical 90% threshold.[6] New analyses using the same data and methodology suggest the field has continued to grow at a similar rate through 2019, with approximately 44,000 hospitalists identified.[7] This shows that the field continues to grow and the model and systems of care associated with hospitalists continues to spread. In 2006, the impact of hospitalists on the care of hospitalized patients would not have been as pronounced as it is today.

Hospitalist practice diverges from the model of outpatient primary care rounding in the hospital on their patients in several important ways. First, hospitalists provide 24-hour coverage of patients in the hospital using a shift-based model. Shifts are typically 12 (~64% of groups) or 10 (~20% of groups) hours long.[8] Shift-based coverage makes at least one handoff between physicians during a 24-hour period ubiquitous. About 50% of hospitalist groups use a daytime admitter model or a hybrid for admissions,[9] meaning patients who enter the hospital overnight are admitted by one clinician and then dedicated staff the following morning continue the care. These handoffs make assessments of time spent with the patient on a calendar day difficult, but reflect the reality of team-based care in many hospitals.

Finally, using 90% threshold-identified hospitalists to examine trends in Medicare billing data shows that, in 2019, hospitalists are billing the plurality of charges for nearly all of the hospital visit E/M codes. For example, in 2019, hospitalists accounted for 10.2% of 99221, 15.1% of 99222 and 31.9% of 99223 of the total volume of Medicare bills for each of these codes.[10]

We concede that the existing data in the RUC database attributes a much smaller proportion of billing claims to hospitalists as this includes only the small proportion of hospitalists who voluntarily identified in PECOS using a recently established Medicare specialty billing code (C6). However, given the demonstrated growth in the number of hospitalists, the 2006 valuations reflected a provider mix that is no longer representative of the healthcare system today. Therefore we believe this meets the CE criteria for shift to another specialty with different knowledge base.

Survey Analysis

The specialty societies discussed that the work RVUs for the initial inpatient/observation codes, the discharge codes, and the same day admission/discharge codes must be in proper rank order to each other (and to the office visit codes). Similarly, the

[10] Unpublished analysis by the Society of Hospital Medicine on publicly available Medicare Provider Utilization and Payment Data.

subsequent inpatient/observation visit codes must be in proper rank order to the initial visit codes and comparable office visit codes.

As a threshold matter, the expert panel reviewed the intensity/complexity measures for all the codes. For virtually all the codes, well over 50% of respondents reported that the intensity and complexity of these services was somewhat, or much more than the reference services which were mostly office visits. This confirmed the panel's understanding that inpatient visits are more intense the outpatient office visits.

99221 Review and Recommendations

There were 230 respondents of whom 87% found the vignette to be typical. The survey times and median RVW were 0/40/0/40/1.95 and the 25th percentile RVW was 1.63.

The previous data was: 265 respondents of whom 88% found the vignette to be typical. The survey times and median work RVU were 0/30/0/30/1.8 and the 25th percentile work RVU was 1.50.

The current times and work RVU are 10/30/50/90/1.92.

The two key reference services were 99203, *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter*, with times and work RVU of 5/25/5/35/1.60, and 99204, *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter*, with times and work RVU of 10/40/10/60/2.60 .

These were the same key reference services as for the previous survey.

99221 can be reported for SF or low-level MDM. The total time of 40 minutes on day of encounter is the same as the day of encounter intra time for 99204 and 15 minutes more intra than the day of encounter time for 99203.

The expert panel agreed that the vast majority of patients will require low level MDM and that the survey time of 40 minutes and greater intensity of inpatient visits support the current value of 1.92. The 25th percentile RVW of 1.63 is too low as it does not reflect the time of 99221 and the added intensity of hospital work.

Therefore, the expert panel recommends 40 minutes of intra-service / total time and maintaining the current RVW of 1.92.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99221, 99218

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Internal Medicine	How often? Commonly
Specialty Nurse Practitioner	How often? Commonly
Specialty General Surgery	How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 5740020
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We anticipate 3 times the annual Medicare utilization; based on 2019 utilization data.

Specialty Internal Medicine	Frequency 771639	Percentage 13.44 %
Specialty Nurse Practitioner	Frequency 453967	Percentage 7.90 %
Specialty General Surgery	Frequency 427574	Percentage 7.44 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,913,340 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2019 Medicare utilization from the RUC database.

Specialty Internal Medicine	Frequency 257213	Percentage 13.44 %
Specialty Nurse Practitioner	Frequency 151322	Percentage 7.90 %
Specialty General Surgery	Frequency 142525	Percentage 7.44 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Hospital visit

BETOS Sub-classification Level II:
Initial

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99221

Presented Recommended RVU: **2.60**
Global Period: XXX Current Work RVU: **2.61** RUC Recommended RVU: **2.60**

CPT Descriptor: Initial hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with an acute illness with systemic symptoms or acute complicated injury is admitted for either initial inpatient or observation care services.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Review available prior medical records and data, place requests for other records and data as necessary for the new patient visit/obs/admission service. Coordinate with other members of the health care team regarding the obs/admission service. Visit patient location (e.g., floor, observation area, unit) confirm patient's identity. Review the medical history with the patient and/or family/caregiver. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan (requiring moderate medical decision making [MDM]). Consider discharge needs of patient. Discuss the treatment plan with patient and family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write and/or review observation or inpatient admission orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Document the encounters throughout the calendar day in the medical record. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family and/or caregivers throughout the calendar day. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver that may occur within the calendar day and respond to treatment failures.

Description of Post-Service Work:

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99204	XXX	2.60	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99205	XXX	3.50	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99204	XXX	2.60	**RUC Time**	10,714,246

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99205	XXX	3.50	**RUC Time**	2,923,626

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	2%	29%	52%	17%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	29%	68%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	1%	65%	34%
Physical effort required	3%	55%	42%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	2%	23%	75%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	4%	26%	46%	24%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	35%	58%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	59%	37%
Physical effort required	4%	43%	53%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	20%	80%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In February 2021, the CPT Editorial Panel deleted seven observation care codes and revised eleven codes to merge inpatient and observation care and to align with the principles included in the office or other outpatient E/M services (99202-99215) by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visit codes, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of an inpatient hospital or observation care visit code, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing and managing the patient are summed to select the appropriate code. The inpatient and observation care services were surveyed for the October 2021 RUC meeting. The survey time captured the total time on the date of encounter by calendar date. All the codes were surveyed in June/July and discussed at length for the October 2021 RUC meeting as well as several pre facilitation meetings.

In October 2021, the RUC referred these services to be resurveyed because the survey did not include a request for distinct time before and after floor/unit time, therefore could not be compared to previous RUC surveys of these services.

The Inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) were surveyed again by the specialty societies with the research approved revised survey tool. The survey societies sent out the survey randomly to members in November 2021 for presentation at the January 2022 RUC meeting.

The surveying societies were:
American Academy of Hospice and Palliative Medicine
American Academy of Neurology
American Association of Neurological Surgeons/Congress of Neurological Surgeons
American Academy of Orthopaedic Surgeons
American Academy of Pediatrics
American Association for Thoracic Surgery
American College of Cardiology
American College of Chest Physicians
American College of Obstetricians and Gynecologists
American College of Physicians
American College of Surgeons
American Geriatrics Society
American Nurses Association
American Society of Clinical Oncology
American Society of Colon and Rectal Surgeons
American Society for Surgery of the Hand
American Thoracic Society
Infectious Diseases Society of America
North American Spine Society
Society of Hospital Medicine
Society of Thoracic Surgeons
Society for Vascular Surgery

Details of the Research Approved Revised Survey Tool for inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) at the January 2021 RUC meeting

As discussed at the October 2021 RUC meeting, the specialty societies believed that the intraservice time data was flawed. The societies believed that some respondents may have only been considering floor/unit time and not the time before or after floor/unit time on the date of encounter. The RUC agreed with the specialty societies to resurvey the inpatient and observation E/M services, after revision of the survey tool to include definitions of time before and after floor/unit time. This would allow better comparison to prior surveys that included these time components. It should be noted that although the revised survey tool included a worksheet question asking for separate on/off floor times on the date of service, this question was followed by a question that included the summed total time for respondent confirmation that the total time was accurate. If the respondent did not agree with the total time for one or more of the codes as arrayed, then the respondent was asked to return to the worksheet question and adjust the times as needed. The respondent could not move forward in the survey before affirming that the total times on the date of encounter were accurate. This total time confirmation is important because the joint societies believe the correct analysis is to use the total time as confirmed by the survey respondent. Both survey tools are included in the RUC materials. We note that the total time presented in our SoRs and in our RUC summary materials are the statistics of the total time as calculated in the survey tool and verified by the survey respondent. For full transparency, additional details on the survey tool questions and responses is provided in a separate informational file.

Compelling Evidence

We believe we meet several compelling evidence criteria

1.) Documentation by "Other reliable data" for change in physician work
   a. *Change in patient population*
   b. *Change in length of hospital stay*
   c. *Change in Technology*
   d. *Change in Knowledge (new provider type)*

Documentation by Other reliable data

Our compelling evidence is based on four types of changes: a.) patient population; b.) reduced length of stay; c.) change in technology (inpatient EHRs); and d.) change in knowledge (new provider type). We believe each of these meet the criteria for "***other reliable data.***"

Change in patient population

The number of diagnoses that appear in the Medicare claims for Inpatient Visits (based on the 5% file) has increased over the years since these codes were last reviewed. The largest changes are occurring at the higher-level services. Since 2006 the number of diagnoses has increased by more than 30% for all the codes except 99221 and 99222 which have gone up 25%. For example, for 99223 the number has increased by 31% and for 99233, the increase is 41%.

Our experts are experiencing more complicated patients, with more clinical indications to review and consider, while balancing moving these more complicated patients to the next setting of care, such as a SNF. The chart below supports the fact that patients at higher level codes have more indications to consider in decision making and physicians/QHP caring for these patients are being asked to move those patients along to the next level of care and shorter LOS.

CPT Code	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	Percentage Change

The demographics of hospitalized patients continue to change over time, particularly as payors and patients apply pressure to provide care in the lowest, safest acuity setting. Medicare and Medicaid patients continue to grow as a proportion of inpatient stays. In 1999, Medicare patients made up 35.9% of inpatients and Medicaid patients, 16.6%. By 2018, these proportions increased significantly: Medicare (40.9%) and Medicaid (22.7%).[1] This shift was almost entirely accounted for by decrease in inpatients with private insurance, while overall number of hospitalizations nationwide remained relatively constant. Over the

[1] Agency for Healthcare Research and Quality (AHRQ). HCUP Fast Stats—Trends in Inpatient Stays. Accessed November 29, 2021, via https://www.hcup-us.ahrq.gov/faststats/NationalTrendsServlet/

same 1999-2018 period, average length of stay for Medicare patients declined from 6.0 days to 5.2 days and Medicaid patients stayed similar (4.5 days to 4.6 days).[2]

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

Change in length of hospital stay

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

In addition, a published report from the OIG has documented significant decreases in length of stay and that hospitals are billing the highest severity DRGs more frequently.

The OIG stated:
"Hospitals are increasingly billing for inpatient stays at the highest severity level, which is the most expensive one. The number of stays at the highest severity level increased almost 20 percent from FY 2014 through FY 2019, ultimately accounting for nearly half of all Medicare spending on inpatient hospital stays. The number of stays billed at each of the other severity levels decreased. At the same time, the average length of stay decreased for stays at the highest severity level, while the average length of all stays remained largely the same."

While this OIG article suggests that providers may be upcoding, the expert panels' experience suggest that the trend supports the fact that physicians/QHPs are caring for patients who have many more contributing conditions and increased pressure to get the patient on to the next level of care outside the acute care setting of the inpatient stay. This requires more intense and complex work in a shorter period of time.

Change in Technology

Outpatient EHRs are significantly different from inpatient EHRs. Some of the most obvious differences are requirements for pharmacy potential interactions to be overridden by the physician, as necessary. Additionally, flags are frequently popping up as they are put in place for safety reasons, however, these flags require physician/QHP rather than clinical staff to review and override after decisions for treatments have been modified and thus requires the physician/QHP to go back to the EHR before the clinical staff can continue with care of the patient such as a medication change.

The American Hospital Association reported that in 2017[3] 95% of hospitals had some form of EHR implemented. This is significant change from 2006. As reported in 2006 by the Healthcare Financial Management Association, only 13% of hospitals had an EHR for health outcomes; 13% for clinical decision support; and 2% for patient access.

[2] Agency for Healthcare Research and Quality (AHRQ). HCUP Fast Stats—Trends in Inpatient Stays. Accessed November 29, 2021, via https://www.hcup-us.ahrq.gov/faststats/NationalTrendsServlet/

[3] SOURCE: ONC/American Hospital Association (AHA), AHA Annual Survey Information Technology Supplement: 2015-2017.

Data from the Chronic Conditions Data Warehouse also support our assertion that Medicare patients have increasing rates of comorbidities that in turn increase the complexity of hospitalizations. In addition to high prevalence of diabetes, hypertension and COPD among Medicare beneficiaries, there has been marked increase between 2010 and 2019 in rates of chronic kidney disease (15% to 26%), depression (14% to 19%) and rheumatoid arthritis/osteoarthritis (29% to 35%).

Change in Knowledge (new HOSPITALIST specialty provider type)

Hospitalists are a new specialty that was not fully organized as a specialty in 2006 when the codes were last surveyed and is a specialty that continues to grow. The term "hospitalist" was coined in 1996 to describe a trend of primary care physicians choosing to practice exclusively in the hospital[4] and the field began to organize in earnest in the early 2000s. Hospitalists are predominantly internal medicine trained, but there are also a significant number of hospitalists with the specialties of family medicine, pediatrics, and medical subspecialties. In 2011, there were 25,787 adult hospitalists identified using a 90% threshold of Medicare billing claims associated with hospitalizations.[5] In 2012, there were 28,473 hospitalists identified using a nearly identical 90% threshold.[6] New analyses using the same data and methodology suggest the field has continued to grow at a similar rate through 2019, with approximately 44,000 hospitalists identified.[7] This shows that the field continues to grow and the model and systems of care associated with hospitalists continues to spread. In 2006, the impact of hospitalists on the care of hospitalized patients would not have been as pronounced as it is today.

Hospitalist practice diverges from the model of outpatient primary care rounding in the hospital on their patients in several important ways. First, hospitalists provide 24-hour coverage of patients in the hospital using a shift-based model. Shifts are typically 12 (~64% of groups) or 10 (~20% of groups) hours long.[8] Shift-based coverage makes at least one handoff between physicians during a 24-hour period ubiquitous. About 50% of hospitalist groups use a daytime admitter model or a hybrid for admissions,[9] meaning patients who enter the hospital overnight are admitted by one clinician and then dedicated staff the following morning continue the care. These handoffs make assessments of time spent with the patient on a calendar day difficult, but reflect the reality of team-based care in many hospitals.

Finally, using 90% threshold-identified hospitalists to examine trends in Medicare billing data shows that, in 2019, hospitalists are billing the plurality of charges for nearly all of the hospital visit E/M codes. For example, in 2019, hospitalists accounted for 10.2% of 99221, 15.1% of 99222 and 31.9% of 99223 of the total volume of Medicare bills for each of these codes.[10]

We concede that the existing data in the RUC database attributes a much smaller proportion of billing claims to hospitalists as this includes only the small proportion of hospitalists who voluntarily identified in PECOS using a recently established Medicare specialty billing code (C6). However, given the demonstrated growth in the number of hospitalists, the 2006 valuations reflected a provider mix that is no longer representative of the healthcare system today. Therefore we believe this meets the CE criteria for shift to another specialty with different knowledge base.

Survey Analysis

The specialty societies discussed that the work RVUs for the initial inpatient/observation codes, the discharge codes, and the same day admission/discharge codes must be in proper rank order to each other (and to the office visit codes). Similarly, the subsequent inpatient/observation visit codes must be in proper rank order to the initial visit codes and comparable office visit codes.

Note: The sample consists of 3,599 non-federal acute care hospitals. "There was a 7 percent increase between 2015 and 2016 in the percent of hospitals that use their EHR data." ONC Data Brief ■ No. 46■ April 2019

As a threshold matter, the expert panel reviewed the intensity/complexity measures for all the codes. For virtually all the codes, well over 50% of respondents reported that the intensity and complexity of these services was somewhat, or much more than the reference services which were mostly office visits. This confirmed the panel's understanding that inpatient visits are more intense the outpatient office visits.

99222 Review and Recommendations

There were 250 respondents of whom 96% found the vignette to be typical. The survey times and median RVW were 0/55/0/55/2.81 and the 25th percentile was 2.60.

The previous data was: 107 respondents of whom 93% found the vignette to be typical. The survey times and median work RVU were 0/45/0/45/2.80. The 25th percentile work RVU was 2.53.

The current times and work RVU are 15/40/20/75/2.61.

The key reference services were 99204, *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter*, with times and work RVU of 10/40/10/60/2.60, and 99205, *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter*, with times and work RVU of 14/59/15/88/3.50.

The key reference services were the same for the previous survey.

The survey time of 55 minutes is five minutes less than the total time for 99204 which has the same level of MDM as 99222. The expert panel agreed that between the survey 25th and 50th percentile RVW of 2.61 places 99222 in proper rank order to 99204 because of the higher intensity of inpatient work. In addition, the survey time of 55 minutes is 50% higher than the survey time for 99221 (36 minutes) and the survey 25th percentile RVW of 2.61 is 60% higher than the recommended work RVU for 99221 (1.63). Finally, the 2.61 is the current value for 99222.

Therefore, the expert panel recommends the survey intra/total time of 55 minutes and maintaining the current RVW of 2.61.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99222, 99219

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Internal Medicine How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Nephrology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 21403900
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We anticipate 3 times the annual Medicare utilization; based on 2019 utilization data.

Specialty Internal Medicine Frequency 4353900 Percentage 20.34 %

Specialty Cardiology Frequency 1937822 Percentage 9.05 %

Specialty Nephrology Frequency 1337097 Percentage 6.24 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,134,401 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2019 Medicare utilization from the RUC database.

Specialty Internal Medicine Frequency 1451300 Percentage 20.34 %

Specialty Cardiology Frequency 645941 Percentage 9.05 %

Specialty Nephrology Frequency 445699 Percentage 6.24 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Hospital visit

BETOS Sub-classification Level II:
Initial

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99222

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99223 Tracking Number F3 Original Specialty Recommended RVU: **3.86**
Presented Recommended RVU: **3.86**
Global Period: XXX Current Work RVU: **3.86** RUC Recommended RVU: **3.50**

CPT Descriptor: Initial hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with a chronic illness with severe exacerbation, or an acute illness/injury that poses a threat to life or bodily function is admitted for either initial inpatient or observation care services.

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Review available prior medical records and data, place requests for other records and data as necessary for the new patient visit/obs/admission service. Coordinate with other members of the health care team regarding the obs/admission service. Visit patient location (e.g., floor, observation area, unit) confirm patient's identity. Review the medical history with the patient and/or family/caregiver. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan (requiring high medical decision making [MDM]). Consider discharge needs of patient. Discuss the treatment plan with patient and family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write and/or review observation or inpatient admission orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Document the encounters throughout the calendar day in the medical record. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family and/or caregivers throughout the calendar day. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver that may occur within the calendar day and respond to treatment failures.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	1%	1%	16%	29%	53%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	2%	22%	76%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	1%	52%	47%
Physical effort required	3%	41%	56%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	2%	11%	87%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	12%	45%	21%	22%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	57%	36%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	29%	47%	24%
Physical effort required	22%	47%	31%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	19%	33%	48%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In February 2021, the CPT Editorial Panel deleted seven observation care codes and revised eleven codes to merge inpatient and observation care and to align with the principles included in the office or other outpatient E/M services (99202-99215) by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visit codes, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of an inpatient hospital or observation care visit code, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing and managing the patient are summed to select the appropriate code. The inpatient and observation care services were surveyed for the October 2021 RUC meeting. The survey time captured the total time on the date of encounter by calendar date. All the codes were surveyed in June/July and discussed at length for the October 2021 RUC meeting as well as several pre facilitation meetings.

In October 2021, the RUC referred these services to be resurveyed because the survey did not include a request for distinct time before and after floor/unit time, therefore could not be compared to previous RUC surveys of these services.

The Inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) were surveyed again by the specialty societies with the research approved revised survey tool. The survey societies sent out the survey randomly to members in November 2021 for presentation at the January 2022 RUC meeting.

The surveying societies were:
American Academy of Hospice and Palliative Medicine
American Academy of Neurology
American Association of Neurological Surgeons/Congress of Neurological Surgeons
American Academy of Orthopaedic Surgeons
American Academy of Pediatrics
American Association for Thoracic Surgery
American College of Cardiology
American College of Chest Physicians
American College of Obstetricians and Gynecologists
American College of Physicians
American College of Surgeons
American Geriatrics Society
American Nurses Association
American Society of Clinical Oncology
American Society of Colon and Rectal Surgeons
American Society for Surgery of the Hand
American Thoracic Society
Infectious Diseases Society of America
North American Spine Society
Society of Hospital Medicine
Society of Thoracic Surgeons
Society for Vascular Surgery

Details of the Research Approved Revised Survey Tool for inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) at the January 2021 RUC meeting

As discussed at the October 2021 RUC meeting, the specialty societies believed that the intraservice time data was flawed. The societies believed that some respondents may have only been considering floor/unit time and not the time before or after floor/unit time on the date of encounter. The RUC agreed with the specialty societies to resurvey the inpatient and observation E/M services, after revision of the survey tool to include definitions of time before and after floor/unit time. This would allow better comparison to prior surveys that included these time components. It should be noted that although the revised survey tool included a worksheet question asking for separate on/off floor times on the date of service, this question was followed by a question that included the summed total time for respondent confirmation that the total time was accurate. If the respondent did not agree with the total time for one or more of the codes as arrayed, then the respondent was asked to return to the worksheet question and adjust the times as needed. The respondent could not move forward in the survey before affirming that the total times on the date of encounter were accurate. This total time confirmation is important because the joint societies believe the correct analysis is to use the total time as confirmed by the survey respondent. Both survey tools are included in the RUC materials. We note that the total time presented in our SoRs and in our RUC summary materials are the statistics of the total time as calculated in the survey tool and verified by the survey respondent. For full transparency, additional details on the survey tool questions and responses is provided in a separate informational file.

Compelling Evidence

We believe we meet several compelling evidence criteria

1.) Documentation by "Other reliable data" for change in physician work
   a. *Change in patient population*
   b. *Change in length of hospital stay*
   c. *Change in Technology*
   d. *Change in Knowledge (new provider type)*

Documentation by Other reliable data

Our compelling evidence is based on four types of changes: a.) patient population; b.) reduced length of stay; c.) change in technology (inpatient EHRs); and d.) change in knowledge (new provider type). We believe each of these meet the criteria for "***other reliable data.***"

Change in patient population

The number of diagnoses that appear in the Medicare claims for Inpatient Visits (based on the 5% file) has increased over the years since these codes were last reviewed. The largest changes are occurring at the higher-level services. Since 2006 the number of diagnoses has increased by more than 30% for all the codes except 99221 and 99222 which have gone up 25%. For example, for 99223 the number has increased by 31% and for 99233, the increase is 41%.

Our experts are experiencing more complicated patients, with more clinical indications to review and consider, while balancing moving these more complicated patients to the next setting of care, such as a SNF. The chart below supports the fact that patients at higher level codes have more indications to consider in decision making and physicians/QHP caring for these patients are being asked to move those patients along to the next level of care and shorter LOS.

CPT Code	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	Percentage Change

The demographics of hospitalized patients continue to change over time, particularly as payors and patients apply pressure to provide care in the lowest, safest acuity setting. Medicare and Medicaid patients continue to grow as a proportion of inpatient stays. In 1999, Medicare patients made up 35.9% of inpatients and Medicaid patients, 16.6%. By 2018, these proportions increased significantly: Medicare (40.9%) and Medicaid (22.7%).[1] This shift was almost entirely accounted for by decrease in inpatients with private insurance, while overall number of hospitalizations nationwide remained relatively constant. Over the

[1] Agency for Healthcare Research and Quality (AHRQ). HCUP Fast Stats—Trends in Inpatient Stays. Accessed November 29, 2021, via https://www.hcup-us.ahrq.gov/faststats/NationalTrendsServlet/

same 1999-2018 period, average length of stay for Medicare patients declined from 6.0 days to 5.2 days and Medicaid patients stayed similar (4.5 days to 4.6 days).[2]

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

Change in length of hospital stay

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

In addition, a published report from the OIG has documented significant decreases in length of stay and that hospitals are billing the highest severity DRGs more frequently.

The OIG stated:
"Hospitals are increasingly billing for inpatient stays at the highest severity level, which is the most expensive one. The number of stays at the highest severity level increased almost 20 percent from FY 2014 through FY 2019, ultimately accounting for nearly half of all Medicare spending on inpatient hospital stays. The number of stays billed at each of the other severity levels decreased. At the same time, the average length of stay decreased for stays at the highest severity level, while the average length of all stays remained largely the same."

While this OIG article suggests that providers may be upcoding, the expert panels' experience suggest that the trend supports the fact that physicians/QHPs are caring for patients who have many more contributing conditions and increased pressure to get the patient on to the next level of care outside the acute care setting of the inpatient stay. This requires more intense and complex work in a shorter period of time.

Change in Technology

Outpatient EHRs are significantly different from inpatient EHRs. Some of the most obvious differences are requirements for pharmacy potential interactions to be overridden by the physician, as necessary. Additionally, flags are frequently popping up as they are put in place for safety reasons, however, these flags require physician/QHP rather than clinical staff to review and override after decisions for treatments have been modified and thus requires the physician/QHP to go back to the EHR before the clinical staff can continue with care of the patient such as a medication change.

The American Hospital Association reported that in 2017[3] 95% of hospitals had some form of EHR implemented. This is significant change from 2006. As reported in 2006 by the Healthcare Financial Management Association, only 13% of hospitals had an EHR for health outcomes; 13% for clinical decision support; and 2% for patient access.

[3] SOURCE: ONC/American Hospital Association (AHA), AHA Annual Survey Information Technology Supplement: 2015-2017.

Data from the Chronic Conditions Data Warehouse also support our assertion that Medicare patients have increasing rates of comorbidities that in turn increase the complexity of hospitalizations. In addition to high prevalence of diabetes, hypertension and COPD among Medicare beneficiaries, there has been marked increase between 2010 and 2019 in rates of chronic kidney disease (15% to 26%), depression (14% to 19%) and rheumatoid arthritis/osteoarthritis (29% to 35%).

Change in Knowledge (new HOSPITALIST specialty provider type)

Hospitalists are a new specialty that was not fully organized as a specialty in 2006 when the codes were last surveyed and is a specialty that continues to grow. The term "hospitalist" was coined in 1996 to describe a trend of primary care physicians choosing to practice exclusively in the hospital[4] and the field began to organize in earnest in the early 2000s. Hospitalists are predominantly internal medicine trained, but there are also a significant number of hospitalists with the specialties of family medicine, pediatrics, and medical subspecialties. In 2011, there were 25,787 adult hospitalists identified using a 90% threshold of Medicare billing claims associated with hospitalizations.[5] In 2012, there were 28,473 hospitalists identified using a nearly identical 90% threshold.[6] New analyses using the same data and methodology suggest the field has continued to grow at a similar rate through 2019, with approximately 44,000 hospitalists identified.[7] This shows that the field continues to grow and the model and systems of care associated with hospitalists continues to spread. In 2006, the impact of hospitalists on the care of hospitalized patients would not have been as pronounced as it is today.

Hospitalist practice diverges from the model of outpatient primary care rounding in the hospital on their patients in several important ways. First, hospitalists provide 24-hour coverage of patients in the hospital using a shift-based model. Shifts are typically 12 (~64% of groups) or 10 (~20% of groups) hours long.[8] Shift-based coverage makes at least one handoff between physicians during a 24-hour period ubiquitous. About 50% of hospitalist groups use a daytime admitter model or a hybrid for admissions,[9] meaning patients who enter the hospital overnight are admitted by one clinician and then dedicated staff the following morning continue the care. These handoffs make assessments of time spent with the patient on a calendar day difficult, but reflect the reality of team-based care in many hospitals.

Finally, using 90% threshold-identified hospitalists to examine trends in Medicare billing data shows that, in 2019, hospitalists are billing the plurality of charges for nearly all of the hospital visit E/M codes. For example, in 2019, hospitalists accounted for 10.2% of 99221, 15.1% of 99222 and 31.9% of 99223 of the total volume of Medicare bills for each of these codes.[10]

We concede that the existing data in the RUC database attributes a much smaller proportion of billing claims to hospitalists as this includes only the small proportion of hospitalists who voluntarily identified in PECOS using a recently established Medicare specialty billing code (C6). However, given the demonstrated growth in the number of hospitalists, the 2006 valuations reflected a provider mix that is no longer representative of the healthcare system today. Therefore we believe this meets the CE criteria for shift to another specialty with different knowledge base.

Survey Analysis

The specialty societies discussed that the work RVUs for the initial inpatient/observation codes, the discharge codes, and the same day admission/discharge codes must be in proper rank order to each other (and to the office visit codes). Similarly, the subsequent inpatient/observation visit codes must be in proper rank order to the initial visit codes and comparable office visit codes.

Note: The sample consists of 3,599 non-federal acute care hospitals. "There was a 7 percent increase between 2015 and 2016 in the percent of hospitals that use their EHR data." ONC Data Brief ■ No. 46■ April 2019

As a threshold matter, the expert panel reviewed the intensity/complexity measures for all the codes. For virtually all the codes, well over 50% of respondents reported that the intensity and complexity of these services was somewhat, or much more than the reference services which were mostly office visits. This confirmed the panel's understanding that inpatient visits are more intense the outpatient office visits.

99223 Review and Recommendations

There were 257 respondents of whom 99% found the vignette to be typical. The survey times and median RVW were 0/74/0/74/4.00 and the 25th percentile RVW was 3.50.

The previous survey data was: 302 respondents of whom 97% found the vignette to be typical. The survey times and median work RVU were 0/60/0/60/3.86. The survey 25th percentile was 3.50.

The current times and work RVU are 15/55/20/90/3.86.

The key reference services were, 99205, *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter*, with times and work RVU of 14/59/15/88/3.5, and 99291, *Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes*, with times and work RVU of 15/40/15/70/4.50.

The key reference services from the previous survey were the same.

The survey time of 74 minutes is 14 minutes less than the total time of 99205 but 4 minutes longer than that of 99291. The expert panel agreed that the current RVW of 3.86 was appropriate and placed 99223 in proper rank order to 99205 because of the higher intensity of inpatient care. In addition, 3.86 places 99223 in proper rank order to 99291 which is of higher intensity but has lower intra-service time. The expert panel also noted that the survey time of 74 minutes is 34% more than the survey time for 99222 (55 minutes) and the current RVW of 3.86 is 48% more than the recommended work RVU for 99222 (2.60).

Therefore, the expert panel recommends the intra/total time of 74 minutes and maintain the current RVW of 3.86.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99223, 99220

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Internal Medicine How often? Commonly

Specialty Hospitalist How often? Commonly

Specialty Cardiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 36675741
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We anticipate 3 times the annual Medicare utilization; based on 2019 utilization data.

Specialty Internal Medicine Frequency 11243794 Percentage 30.65 %

Specialty Hospitalist Frequency 3060532 Percentage 8.34 %

Specialty Cardiology Frequency 2677965 Percentage 7.30 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 12,225,247 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2019 Medicare utilization from the RUC database.

Specialty Internal Medicine Frequency 3747931 Percentage 30.65 %

Specialty Hospitalist Frequency 1020177 Percentage 8.34 %

Specialty Cardiology Frequency 892655 Percentage 7.30 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Hospital visit

BETOS Sub-classification Level II:
Initial

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99223

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

SUMMARY OF RECOMMENDATION

CPT Code:99231 Tracking Number F4 Original Specialty Recommended RVU: **1.00**
Presented Recommended RVU: **1.00**
Global Period: XXX Current Work RVU: **0.76** RUC Recommended RVU: **1.00**

CPT Descriptor: Subsequent hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with an acute illness or injury whose condition is improving or is stable receives subsequent hospital inpatient or observation care.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: If necessary, review interval correspondence, referral notes, and medical records generated since the last visit/obs/admission service. Coordinate with other members of the health care team regarding the obs/admission service. Visit patient location (e.g., floor, observation area, unit) confirm patient's identity. Review the medical history with the patient as well as the prior clinical notes. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Update pertinent components of HPI, review of systems, social history, family history, and allergies, and reconcile the patient's medications. Perform a medically appropriate examination. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan (requiring straightforward or low medical decision making [MDM]). Consider discharge needs of patient. Discuss the treatment plan with patient and family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write and/or review observation or inpatient admission orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Document the encounters throughout the calendar day in the medical record. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family and/or caregivers throughout the calendar day. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver that may occur within the calendar day and respond to treatment failures.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	1%	5%	49%	42%	3%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	10%	49%	41%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	70%	22%
Physical effort required	9%	54%	37%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	3%	46%	51%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	8%	51%	41%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	55%	37%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	74%	22%
Physical effort required	2%	69%	29%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	12%	47%	41%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In February 2021, the CPT Editorial Panel deleted seven observation care codes and revised eleven codes to merge inpatient and observation care and to align with the principles included in the office or other outpatient E/M services (99202-99215) by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visit codes, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of an inpatient hospital or observation care visit code, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing and managing the patient are summed to select the appropriate code. The inpatient and observation care services were surveyed for the October 2021 RUC meeting. The survey time captured the total time on the date of encounter by calendar date. All the codes were surveyed in June/July and discussed at length for the October 2021 RUC meeting as well as several pre facilitation meetings.

In October 2021, the RUC referred these services to be resurveyed because the survey did not include a request for distinct time before and after floor/unit time, therefore could not be compared to previous RUC surveys of these services.

The Inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) were surveyed again by the specialty societies with the research approved revised survey tool. The survey societies sent out the survey randomly to members in November 2021 for presentation at the January 2022 RUC meeting.

The surveying societies were:
American Academy of Hospice and Palliative Medicine
American Academy of Neurology
American Association of Neurological Surgeons/Congress of Neurological Surgeons
American Academy of Orthopaedic Surgeons
American Academy of Pediatrics
American Association for Thoracic Surgery
American College of Cardiology
American College of Chest Physicians

American College of Physicians
American College of Surgeons
American Geriatrics Society
American Nurses Association
American Society of Clinical Oncology
American Society of Colon and Rectal Surgeons
American Society for Surgery of the Hand
American Thoracic Society
Infectious Diseases Society of America
North American Spine Society
Society of Hospital Medicine
Society of Thoracic Surgeons
Society for Vascular Surgery

Details of the Research Approved Revised Survey Tool for inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) at the January 2021 RUC meeting

As discussed at the October 2021 RUC meeting, the specialty societies believed that the intraservice time data was flawed. The societies believed that some respondents may have only been considering floor/unit time and not the time before or after floor/unit time on the date of encounter. The RUC agreed with the specialty societies to resurvey the inpatient and observation E/M services, after revision of the survey tool to include definitions of time before and after floor/unit time. This would allow better comparison to prior surveys that included these time components. It should be noted that although the revised survey tool included a worksheet question asking for separate on/off floor times on the date of service, this question was followed by a question that included the summed total time for respondent confirmation that the total time was accurate. If the respondent did not agree with the total time for one or more of the codes as arrayed, then the respondent was asked to return to the worksheet question and adjust the times as needed. The respondent could not move forward in the survey before affirming that the total times on the date of encounter were accurate. This total time confirmation is important because the joint societies believe the correct analysis is to use the total time as confirmed by the survey respondent. Both survey tools are included in the RUC materials. We note that the total time presented in our SoRs and in our RUC summary materials are the statistics of the total time as calculated in the survey tool and verified by the survey respondent. For full transparency, additional details on the survey tool questions and responses is provided in a separate informational file.

Compelling Evidence

We believe we meet several compelling evidence criteria

1.) Documentation by "Other reliable data" for change in physician work
   a. *Change in patient population*
   b. *Change in length of hospital stay*
   c. *Change in Technology*
   d. *Change in Knowledge (new provider type)*

Documentation by Other reliable data

Our compelling evidence is based on four types of changes: a.) patient population; b.) reduced length of stay; c.) change in technology (inpatient EHRs); and d.) change in knowledge (new provider type). We believe each of these meet the criteria for "***other reliable data.***"

Change in patient population

The number of diagnoses that appear in the Medicare claims for Inpatient Visits (based on the 5% file) has increased over the years since these codes were last reviewed. The largest changes are occurring at the higher-level services. Since 2006 the number of diagnoses has increased by more than 30% for all the codes except 99221 and 99222 which have gone up 25%. For example, for 99223 the number has increased by 31% and for 99233, the increase is 41%.

Our experts are experiencing more complicated patients, with more clinical indications to review and consider, while balancing moving these more complicated patients to the next setting of care, such as a SNF. The chart below supports the fact that patients at higher level codes have more indications to consider in decision making and physicians/QHP caring for these patients are being asked to move those patients along to the next level of care and shorter LOS.

CPT Code	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	Percentage Change

The demographics of hospitalized patients continue to change over time, particularly as payors and patients apply pressure to provide care in the lowest, safest acuity setting. Medicare and Medicaid patients continue to grow as a proportion of inpatient stays. In 1999, Medicare patients made up 35.9% of inpatients and Medicaid patients, 16.6%. By 2018, these proportions increased significantly: Medicare (40.9%) and Medicaid (22.7%).[1] This shift was almost entirely accounted for by decrease in inpatients with private insurance, while overall number of hospitalizations nationwide remained relatively constant. Over the

[1] Agency for Healthcare Research and Quality (AHRQ). HCUP Fast Stats—Trends in Inpatient Stays. Accessed November 29, 2021, via https://www.hcup-us.ahrq.gov/faststats/NationalTrendsServlet/

same 1999-2018 period, average length of stay for Medicare patients declined from 6.0 days to 5.2 days and Medicaid patients stayed similar (4.5 days to 4.6 days).[2]

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

Change in length of hospital stay

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

In addition, a published report from the OIG has documented significant decreases in length of stay and that hospitals are billing the highest severity DRGs more frequently.

The OIG stated:
"Hospitals are increasingly billing for inpatient stays at the highest severity level, which is the most expensive one. The number of stays at the highest severity level increased almost 20 percent from FY 2014 through FY 2019, ultimately accounting for nearly half of all Medicare spending on inpatient hospital stays. The number of stays billed at each of the other severity levels decreased. At the same time, the average length of stay decreased for stays at the highest severity level, while the average length of all stays remained largely the same."

While this OIG article suggests that providers may be upcoding, the expert panels' experience suggest that the trend supports the fact that physicians/QHPs are caring for patients who have many more contributing conditions and increased pressure to get the patient on to the next level of care outside the acute care setting of the inpatient stay. This requires more intense and complex work in a shorter period of time.

Change in Technology

Outpatient EHRs are significantly different from inpatient EHRs. Some of the most obvious differences are requirements for pharmacy potential interactions to be overridden by the physician, as necessary. Additionally, flags are frequently popping up as they are put in place for safety reasons, however, these flags require physician/QHP rather than clinical staff to review and override after decisions for treatments have been modified and thus requires the physician/QHP to go back to the EHR before the clinical staff can continue with care of the patient such as a medication change.

The American Hospital Association reported that in 2017[3] 95% of hospitals had some form of EHR implemented. This is significant change from 2006. As reported in 2006 by the Healthcare Financial Management Association, only 13% of hospitals had an EHR for health outcomes; 13% for clinical decision support; and 2% for patient access.

[3] SOURCE: ONC/American Hospital Association (AHA), AHA Annual Survey Information Technology Supplement: 2015-2017.

Data from the Chronic Conditions Data Warehouse also support our assertion that Medicare patients have increasing rates of comorbidities that in turn increase the complexity of hospitalizations. In addition to high prevalence of diabetes, hypertension and COPD among Medicare beneficiaries, there has been marked increase between 2010 and 2019 in rates of chronic kidney disease (15% to 26%), depression (14% to 19%) and rheumatoid arthritis/osteoarthritis (29% to 35%).

Change in Knowledge (new HOSPITALIST specialty provider type)

Hospitalists are a new specialty that was not fully organized as a specialty in 2006 when the codes were last surveyed and is a specialty that continues to grow. The term "hospitalist" was coined in 1996 to describe a trend of primary care physicians choosing to practice exclusively in the hospital[4] and the field began to organize in earnest in the early 2000s. Hospitalists are predominantly internal medicine trained, but there are also a significant number of hospitalists with the specialties of family medicine, pediatrics, and medical subspecialties. In 2011, there were 25,787 adult hospitalists identified using a 90% threshold of Medicare billing claims associated with hospitalizations.[5] In 2012, there were 28,473 hospitalists identified using a nearly identical 90% threshold.[6] New analyses using the same data and methodology suggest the field has continued to grow at a similar rate through 2019, with approximately 44,000 hospitalists identified.[7] This shows that the field continues to grow and the model and systems of care associated with hospitalists continues to spread. In 2006, the impact of hospitalists on the care of hospitalized patients would not have been as pronounced as it is today.

Hospitalist practice diverges from the model of outpatient primary care rounding in the hospital on their patients in several important ways. First, hospitalists provide 24-hour coverage of patients in the hospital using a shift-based model. Shifts are typically 12 (~64% of groups) or 10 (~20% of groups) hours long.[8] Shift-based coverage makes at least one handoff between physicians during a 24-hour period ubiquitous. About 50% of hospitalist groups use a daytime admitter model or a hybrid for admissions,[9] meaning patients who enter the hospital overnight are admitted by one clinician and then dedicated staff the following morning continue the care. These handoffs make assessments of time spent with the patient on a calendar day difficult, but reflect the reality of team-based care in many hospitals.

Finally, using 90% threshold-identified hospitalists to examine trends in Medicare billing data shows that, in 2019, hospitalists are billing the plurality of charges for nearly all of the hospital visit E/M codes. For example, in 2019, hospitalists accounted for 10.2% of 99221, 15.1% of 99222 and 31.9% of 99223 of the total volume of Medicare bills for each of these codes.[10]

We concede that the existing data in the RUC database attributes a much smaller proportion of billing claims to hospitalists as this includes only the small proportion of hospitalists who voluntarily identified in PECOS using a recently established Medicare specialty billing code (C6). However, given the demonstrated growth in the number of hospitalists, the 2006 valuations reflected a provider mix that is no longer representative of the healthcare system today. Therefore we believe this meets the CE criteria for shift to another specialty with different knowledge base.

Survey Analysis

The specialty societies discussed that the work RVUs for the initial inpatient/observation codes, the discharge codes, and the same day admission/discharge codes must be in proper rank order to each other (and to the office visit codes). Similarly, the subsequent inpatient/observation visit codes must be in proper rank order to the initial visit codes and comparable office visit codes.

Note: The sample consists of 3,599 non-federal acute care hospitals. "There was a 7 percent increase between 2015 and 2016 in the percent of hospitals that use their EHR data." ONC Data Brief ■ No. 46■ April 2019

[10] Unpublished analysis by the Society of Hospital Medicine on publicly available Medicare Provider Utilization and Payment Data.

As a threshold matter, the expert panel reviewed the intensity/complexity measures for all the codes. For virtually all the codes, well over 50% of respondents reported that the intensity and complexity of these services was somewhat, or much more than the reference services which were mostly office visits. This confirmed the panel's understanding that inpatient visits are more intense the outpatient office visits.

99231 Review and Recommendations

There were 234 respondents of whom 91% found the vignette to be typical. The survey times and median RVW were 0/25/0/25/1.30 and the 25th percentile RVW was 1.0.

The previous survey data was: 283 respondents of whom 92% found the vignette to be typical. The survey times and median work RVU were 0/17/0/17/1.30. The 25th percentile work RVU was 1.00.

The current times and work RVU are 5/10/5/20/0.76.

The key reference services were 99213, *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter*, with times and work RVU of 5/20/5/30/1.30, and 99212, *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter*, with times and work RVU of 2/11/3/16/0.70.

These were the same key reference services as the previous survey.

The total time of 25 minutes is 5 minutes less than that of 99213 and 9 minutes more than that of 99212. 99231 can be reported for both SF and low-level MDM.

Therefore, the expert panel agreed that the 25th percentile work RVU of 1.00 places 99231 in correct rank order with 99212 and 99213. A work RVU of 1.00 also places 99231 in correct rank order with 99213 which requires low level MDM and has more time.

Therefore, the expert panel recommends the survey intra/total time of 25 minutes and the survey 25th percentile work RVU of 1.00.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99231, 99224

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Internal Medicine How often? Commonly

Specialty Psychiatry How often? Commonly

Specialty Nurse Practitioner How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 20583189
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We anticipate 3 times the annual Medicare utilization; based on 2019 utilization data.

Specialty Internal Medicine Frequency 3222209 Percentage 15.65 %

Specialty Psychiatry Frequency 2566776 Percentage 12.47 %

Specialty Nurse Practitioner Frequency 1960451 Percentage 9.52 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 6,861,063 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2019 Medicare utilization from the RUC database.

Specialty Internal Medicine Frequency 1074070 Percentage 15.65 %

Specialty Psychiatry Frequency 855592 Percentage 12.47 %

Specialty Nurse Practitioner Frequency 653484 Percentage 9.52 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Hospital visit

BETOS Sub-classification Level II:
Subsequent

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99231

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99232 Tracking Number F5 Original Specialty Recommended RVU: **1.59**
Presented Recommended RVU: **1.59**
Global Period: XXX Current Work RVU: **1.39** RUC Recommended RVU: **1.59**

CPT Descriptor: Subsequent hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with an illness or acute injury that is progressing or requires ongoing diagnostic evaluation, medical management or potential surgical treatment receives subsequent hospital inpatient or observation care.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: If necessary, review interval correspondence, referral notes, and medical records generated since the last visit/obs/admission service. Coordinate with other members of the health care team regarding the obs/admission service. Visit patient location (e.g., floor, observation area, unit) confirm patient's identity. Review the medical history with the patient as well as the prior clinical notes. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Update pertinent components of HPI, review of systems, social history, family history, and allergies, and reconcile the patient's medications. Perform a medically appropriate examination. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan (requiring moderate medical decision making [MDM]). Consider discharge needs of patient. Discuss the treatment plan with patient and family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write and/or review observation or inpatient admission orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Document the encounters throughout the calendar day in the medical record. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family and/or caregivers throughout the calendar day. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver that may occur within the calendar day and respond to treatment failures.

Description of Post-Service Work:

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? Yes

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99214	XXX	1.92	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99213	XXX	1.30	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99203	XXX	1.60	**RUC Time**	11,452,897

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99214	XXX	1.92	**RUC Time**	106,900,291

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	2%	34%	53%	11%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	34%	59%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	59%	36%
Physical effort required	6%	50%	44%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	2%	25%	73%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	5%	28%	57%	5%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	5%	33%	62%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	63%	32%
Physical effort required	3%	50%	47%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	3%	32%	65%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In February 2021, the CPT Editorial Panel deleted seven observation care codes and revised eleven codes to merge inpatient and observation care and to align with the principles included in the office or other outpatient E/M services (99202-99215) by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visit codes, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of an inpatient hospital or observation care visit code, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing and managing the patient are summed to select the appropriate code. The inpatient and observation care services were surveyed for the October 2021 RUC meeting. The survey time captured the total time on the date of encounter by calendar date. All the codes were surveyed in June/July and discussed at length for the October 2021 RUC meeting as well as several pre facilitation meetings.

In October 2021, the RUC referred these services to be resurveyed because the survey did not include a request for distinct time before and after floor/unit time, therefore could not be compared to previous RUC surveys of these services.

The Inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) were surveyed again by the specialty societies with the research approved revised survey tool. The survey societies sent out the survey randomly to members in November 2021 for presentation at the January 2022 RUC meeting.

The surveying societies were:
American Academy of Hospice and Palliative Medicine
American Academy of Neurology
American Association of Neurological Surgeons/Congress of Neurological Surgeons
American Academy of Orthopaedic Surgeons
American Academy of Pediatrics
American Association for Thoracic Surgery
American College of Cardiology
American College of Chest Physicians
American College of Obstetricians and Gynecologists
American College of Physicians
American College of Surgeons
American Geriatrics Society
American Nurses Association
American Society of Clinical Oncology
American Society of Colon and Rectal Surgeons
American Society for Surgery of the Hand
American Thoracic Society
Infectious Diseases Society of America
North American Spine Society
Society of Hospital Medicine
Society of Thoracic Surgeons
Society for Vascular Surgery

Details of the Research Approved Revised Survey Tool for inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) at the January 2021 RUC meeting

As discussed at the October 2021 RUC meeting, the specialty societies believed that the intraservice time data was flawed. The societies believed that some respondents may have only been considering floor/unit time and not the time before or after floor/unit time on the date of encounter. The RUC agreed with the specialty societies to resurvey the inpatient and observation E/M services, after revision of the survey tool to include definitions of time before and after floor/unit time. This would allow better comparison to prior surveys that included these time components. It should be noted that although the revised survey tool included a worksheet question asking for separate on/off floor times on the date of service, this question was followed by a question that included the summed total time for respondent confirmation that the total time was accurate. If the respondent did not agree with the total time for one or more of the codes as arrayed, then the respondent was asked to return to the worksheet question and adjust the times as needed. The respondent could not move forward in the survey before affirming that the total times on the date of encounter were accurate. This total time confirmation is important because the joint societies believe the correct analysis is to use the total time as confirmed by the survey respondent. Both survey tools are included in the RUC materials. We note that the total time presented in our SoRs and in our RUC summary materials are the statistics of the total time as calculated in the survey tool and verified by the survey respondent. For full transparency, additional details on the survey tool questions and responses is provided in a separate informational file.

Compelling Evidence

We believe we meet several compelling evidence criteria

1.) Documentation by "Other reliable data" for change in physician work
   a. *Change in patient population*
   b. *Change in length of hospital stay*
   c. *Change in Technology*
   d. *Change in Knowledge (new provider type)*

Documentation by Other reliable data

Our compelling evidence is based on four types of changes: a.) patient population; b.) reduced length of stay; c.) change in technology (inpatient EHRs); and d.) change in knowledge (new provider type). We believe each of these meet the criteria for "***other reliable data.***"

Change in patient population

The number of diagnoses that appear in the Medicare claims for Inpatient Visits (based on the 5% file) has increased over the years since these codes were last reviewed. The largest changes are occurring at the higher-level services. Since 2006 the number of diagnoses has increased by more than 30% for all the codes except 99221 and 99222 which have gone up 25%. For example, for 99223 the number has increased by 31% and for 99233, the increase is 41%.

Our experts are experiencing more complicated patients, with more clinical indications to review and consider, while balancing moving these more complicated patients to the next setting of care, such as a SNF. The chart below supports the fact that patients at higher level codes have more indications to consider in decision making and physicians/QHP caring for these patients are being asked to move those patients along to the next level of care and shorter LOS.

CPT Code	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	Percentage Change

The demographics of hospitalized patients continue to change over time, particularly as payors and patients apply pressure to provide care in the lowest, safest acuity setting. Medicare and Medicaid patients continue to grow as a proportion of inpatient stays. In 1999, Medicare patients made up 35.9% of inpatients and Medicaid patients, 16.6%. By 2018, these proportions increased significantly: Medicare (40.9%) and Medicaid (22.7%).[1] This shift was almost entirely accounted for by decrease in inpatients with private insurance, while overall number of hospitalizations nationwide remained relatively constant. Over the

[1] Agency for Healthcare Research and Quality (AHRQ). HCUP Fast Stats—Trends in Inpatient Stays. Accessed November 29, 2021, via https://www.hcup-us.ahrq.gov/faststats/NationalTrendsServlet/

same 1999-2018 period, average length of stay for Medicare patients declined from 6.0 days to 5.2 days and Medicaid patients stayed similar (4.5 days to 4.6 days).[2]

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

Change in length of hospital stay

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

In addition, a published report from the OIG has documented significant decreases in length of stay and that hospitals are billing the highest severity DRGs more frequently.

The OIG stated:
"Hospitals are increasingly billing for inpatient stays at the highest severity level, which is the most expensive one. The number of stays at the highest severity level increased almost 20 percent from FY 2014 through FY 2019, ultimately accounting for nearly half of all Medicare spending on inpatient hospital stays. The number of stays billed at each of the other severity levels decreased. At the same time, the average length of stay decreased for stays at the highest severity level, while the average length of all stays remained largely the same."

While this OIG article suggests that providers may be upcoding, the expert panels' experience suggest that the trend supports the fact that physicians/QHPs are caring for patients who have many more contributing conditions and increased pressure to get the patient on to the next level of care outside the acute care setting of the inpatient stay. This requires more intense and complex work in a shorter period of time.

Change in Technology

Outpatient EHRs are significantly different from inpatient EHRs. Some of the most obvious differences are requirements for pharmacy potential interactions to be overridden by the physician, as necessary. Additionally, flags are frequently popping up as they are put in place for safety reasons, however, these flags require physician/QHP rather than clinical staff to review and override after decisions for treatments have been modified and thus requires the physician/QHP to go back to the EHR before the clinical staff can continue with care of the patient such as a medication change.

The American Hospital Association reported that in 2017[3] 95% of hospitals had some form of EHR implemented. This is significant change from 2006. As reported in 2006 by the Healthcare Financial Management Association, only 13% of hospitals had an EHR for health outcomes; 13% for clinical decision support; and 2% for patient access.

[2] Agency for Healthcare Research and Quality (AHRQ). HCUP Fast Stats—Trends in Inpatient Stays. Accessed November 29, 2021, via https://www.hcup-us.ahrq.gov/faststats/NationalTrendsServlet/

[3] SOURCE: ONC/American Hospital Association (AHA), AHA Annual Survey Information Technology Supplement: 2015-2017.

Data from the Chronic Conditions Data Warehouse also support our assertion that Medicare patients have increasing rates of comorbidities that in turn increase the complexity of hospitalizations. In addition to high prevalence of diabetes, hypertension and COPD among Medicare beneficiaries, there has been marked increase between 2010 and 2019 in rates of chronic kidney disease (15% to 26%), depression (14% to 19%) and rheumatoid arthritis/osteoarthritis (29% to 35%).

Change in Knowledge (new HOSPITALIST specialty provider type)

Hospitalists are a new specialty that was not fully organized as a specialty in 2006 when the codes were last surveyed and is a specialty that continues to grow. The term "hospitalist" was coined in 1996 to describe a trend of primary care physicians choosing to practice exclusively in the hospital[4] and the field began to organize in earnest in the early 2000s. Hospitalists are predominantly internal medicine trained, but there are also a significant number of hospitalists with the specialties of family medicine, pediatrics, and medical subspecialties. In 2011, there were 25,787 adult hospitalists identified using a 90% threshold of Medicare billing claims associated with hospitalizations.[5] In 2012, there were 28,473 hospitalists identified using a nearly identical 90% threshold.[6] New analyses using the same data and methodology suggest the field has continued to grow at a similar rate through 2019, with approximately 44,000 hospitalists identified.[7] This shows that the field continues to grow and the model and systems of care associated with hospitalists continues to spread. In 2006, the impact of hospitalists on the care of hospitalized patients would not have been as pronounced as it is today.

Hospitalist practice diverges from the model of outpatient primary care rounding in the hospital on their patients in several important ways. First, hospitalists provide 24-hour coverage of patients in the hospital using a shift-based model. Shifts are typically 12 (~64% of groups) or 10 (~20% of groups) hours long.[8] Shift-based coverage makes at least one handoff between physicians during a 24-hour period ubiquitous. About 50% of hospitalist groups use a daytime admitter model or a hybrid for admissions,[9] meaning patients who enter the hospital overnight are admitted by one clinician and then dedicated staff the following morning continue the care. These handoffs make assessments of time spent with the patient on a calendar day difficult, but reflect the reality of team-based care in many hospitals.

Finally, using 90% threshold-identified hospitalists to examine trends in Medicare billing data shows that, in 2019, hospitalists are billing the plurality of charges for nearly all of the hospital visit E/M codes. For example, in 2019, hospitalists accounted for 10.2% of 99221, 15.1% of 99222 and 31.9% of 99223 of the total volume of Medicare bills for each of these codes.[10]

We concede that the existing data in the RUC database attributes a much smaller proportion of billing claims to hospitalists as this includes only the small proportion of hospitalists who voluntarily identified in PECOS using a recently established Medicare specialty billing code (C6). However, given the demonstrated growth in the number of hospitalists, the 2006 valuations reflected a provider mix that is no longer representative of the healthcare system today. Therefore we believe this meets the CE criteria for shift to another specialty with different knowledge base.

Survey Analysis

The specialty societies discussed that the work RVUs for the initial inpatient/observation codes, the discharge codes, and the same day admission/discharge codes must be in proper rank order to each other (and to the office visit codes). Similarly, the subsequent inpatient/observation visit codes must be in proper rank order to the initial visit codes and comparable office visit codes.

Note: The sample consists of 3,599 non-federal acute care hospitals. "There was a 7 percent increase between 2015 and 2016 in the percent of hospitals that use their EHR data." ONC Data Brief ■ No. 46■ April 2019

As a threshold matter, the expert panel reviewed the intensity/complexity measures for all the codes. For virtually all the codes, well over 50% of respondents reported that the intensity and complexity of these services was somewhat, or much more than the reference services which were mostly office visits. This confirmed the panel's understanding that inpatient visits are more intense the outpatient office visits.

99232 Review and Recommendations

There were 252 respondents of whom 97% found the vignette to be typical. The survey times and median RVW were 0/36/0/36/2.00 and the 25th percentile RVW was 1.59.

The previous survey data was: 108 respondents of whom 94% found the vignette to be typical. The survey times and median work RVU were 0/30/0/30/2.00. The 25th percentile work RVU was 1.80.

The current times and work RVU are 10/20/10/40/1.39.

The key reference services were 99214, *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter*, with times and work RVU of 7/30/10/47/1.92, and 99213, *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter*, with times and work RVU of 5/20/5/30/1.30.

These were the same key reference services as the previous survey.

The expert panel noted that the survey total time of 36 minutes is 11 minutes less than the total time of 99214 which has the same level of MDM (moderate). In addition, the total time of 36 minutes is 6 minutes more than the total time of 99213. The expert panel decided that the 25th percentile RVW of 1.59 places 99232 in proper rank order with both key reference services given the higher intensity of inpatient care.

The panel then looked at its recommendation for 99231 and noted that the survey time for 99232 was 44% more than the survey time for 99231 (36 vs. 25) and that the 25th percentile work RVU of 1.59 is appropriately 60% higher than the recommendation for 99231 to account for increased intensity and complexity of work.

Therefore, the expert panel recommends the survey intra/total time of 36 minutes and the survey 25th percentile work RVU of 1.59.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99232, 99225

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Internal Medicine How often? Commonly

Specialty Nephrology How often? Commonly

Specialty Hospitalist How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 135888537
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We anticipate 3 times the annual Medicare utilization; based on 2019 utilization data.

Specialty Internal Medicine Frequency 38511081 Percentage 28.34 %

Specialty Nephrology Frequency 11119387 Percentage 8.18 %

Specialty Hospitalist Frequency 9913671 Percentage 7.29 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 45,296,179 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2019 Medicare utilization from the RUC database.

Specialty Internal Medicine Frequency 12837027 Percentage 28.34 %

Specialty Nephrology Frequency 3706462 Percentage 8.18 %

Specialty Hospitalist Frequency 3304557 Percentage 7.29 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Hospital visit

BETOS Sub-classification Level II:
Subsequent

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99232

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99233 Tracking Number F6 Original Specialty Recommended RVU: **2.40**
Presented Recommended RVU: **2.40**
Global Period: XXX Current Work RVU: **2.00** RUC Recommended RVU: **2.40**

CPT Descriptor: Subsequent hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient who is unstable or has developed a significant complication or a significant new problem receives subsequent hospital inpatient or observation care encounter.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: If necessary, review interval correspondence, referral notes, and medical records generated since the last visit/obs/admission service. Coordinate with other members of the health care team regarding the obs/admission service. Visit patient location (e.g., floor, observation area, unit) confirm patient's identity. Review the medical history with the patient as well as the prior clinical notes. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Update pertinent components of HPI, review of systems, social history, family history, and allergies, and reconcile the patient's medications. Perform a medically appropriate examination. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan (requiring high medical decision making [MDM]). Consider discharge needs of patient. Discuss the treatment plan with patient and family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write and/or review observation or inpatient admission orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Document the encounters throughout the calendar day in the medical record. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family and/or caregivers throughout the calendar day. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver that may occur within the calendar day and respond to treatment failures.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	2%	22%	33%	43%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	30%	67%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	52%	44%
Physical effort required	6%	45%	49%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	2%	18%	80%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	3%	16%	41%	40%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	27%	73%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	3%	49%	48%
Physical effort required	3%	30%	67%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	8%	87%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In February 2021, the CPT Editorial Panel deleted seven observation care codes and revised eleven codes to merge inpatient and observation care and to align with the principles included in the office or other outpatient E/M services (99202-99215) by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visit codes, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of an inpatient hospital or observation care visit code, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing and managing the patient are summed to select the appropriate code. The inpatient and observation care services were surveyed for the October 2021 RUC meeting. The survey time captured the total time on the date of encounter by calendar date. All the codes were surveyed in June/July and discussed at length for the October 2021 RUC meeting as well as several pre facilitation meetings.

In October 2021, the RUC referred these services to be resurveyed because the survey did not include a request for distinct time before and after floor/unit time, therefore could not be compared to previous RUC surveys of these services.

The Inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) were surveyed again by the specialty societies with the research approved revised survey tool. The survey societies sent out the survey randomly to members in November 2021 for presentation at the January 2022 RUC meeting.

The surveying societies were:
American Academy of Hospice and Palliative Medicine
American Academy of Neurology
American Association of Neurological Surgeons/Congress of Neurological Surgeons
American Academy of Orthopaedic Surgeons
American Academy of Pediatrics
American Association for Thoracic Surgery
American College of Cardiology
American College of Chest Physicians
American College of Obstetricians and Gynecologists
American College of Physicians
American College of Surgeons
American Geriatrics Society
American Nurses Association
American Society of Clinical Oncology
American Society of Colon and Rectal Surgeons
American Society for Surgery of the Hand
American Thoracic Society
Infectious Diseases Society of America
North American Spine Society
Society of Hospital Medicine
Society of Thoracic Surgeons
Society for Vascular Surgery

Details of the Research Approved Revised Survey Tool for inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) at the January 2021 RUC meeting

As discussed at the October 2021 RUC meeting, the specialty societies believed that the intraservice time data was flawed. The societies believed that some respondents may have only been considering floor/unit time and not the time before or after floor/unit time on the date of encounter. The RUC agreed with the specialty societies to resurvey the inpatient and observation E/M services, after revision of the survey tool to include definitions of time before and after floor/unit time. This would allow better comparison to prior surveys that included these time components. It should be noted that although the revised survey tool included a worksheet question asking for separate on/off floor times on the date of service, this question was followed by a question that included the summed total time for respondent confirmation that the total time was accurate. If the respondent did not agree with the total time for one or more of the codes as arrayed, then the respondent was asked to return to the worksheet question and adjust the times as needed. The respondent could not move forward in the survey before affirming that the total times on the date of encounter were accurate. This total time confirmation is important because the joint societies believe the correct analysis is to use the total time as confirmed by the survey respondent. Both survey tools are included in the RUC materials. We note that the total time presented in our SoRs and in our RUC summary materials are the statistics of the total time as calculated in the survey tool and verified by the survey respondent. For full transparency, additional details on the survey tool questions and responses is provided in a separate informational file.

Compelling Evidence

We believe we meet several compelling evidence criteria

1.) Documentation by "Other reliable data" for change in physician work
   a. *Change in patient population*
   b. *Change in length of hospital stay*
   c. *Change in Technology*
   d. *Change in Knowledge (new provider type)*

Documentation by Other reliable data

Our compelling evidence is based on four types of changes: a.) patient population; b.) reduced length of stay; c.) change in technology (inpatient EHRs); and d.) change in knowledge (new provider type). We believe each of these meet the criteria for "***other reliable data.***"

Change in patient population

The number of diagnoses that appear in the Medicare claims for Inpatient Visits (based on the 5% file) has increased over the years since these codes were last reviewed. The largest changes are occurring at the higher-level services. Since 2006 the number of diagnoses has increased by more than 30% for all the codes except 99221 and 99222 which have gone up 25%. For example, for 99223 the number has increased by 31% and for 99233, the increase is 41%.

Our experts are experiencing more complicated patients, with more clinical indications to review and consider, while balancing moving these more complicated patients to the next setting of care, such as a SNF. The chart below supports the fact that patients at higher level codes have more indications to consider in decision making and physicians/QHP caring for these patients are being asked to move those patients along to the next level of care and shorter LOS.

CPT Code	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	Percentage Change

The demographics of hospitalized patients continue to change over time, particularly as payors and patients apply pressure to provide care in the lowest, safest acuity setting. Medicare and Medicaid patients continue to grow as a proportion of inpatient stays. In 1999, Medicare patients made up 35.9% of inpatients and Medicaid patients, 16.6%. By 2018, these proportions increased significantly: Medicare (40.9%) and Medicaid (22.7%).[1] This shift was almost entirely accounted for by decrease in inpatients with private insurance, while overall number of hospitalizations nationwide remained relatively constant. Over the

[1] Agency for Healthcare Research and Quality (AHRQ). HCUP Fast Stats—Trends in Inpatient Stays. Accessed November 29, 2021, via https://www.hcup-us.ahrq.gov/faststats/NationalTrendsServlet/

same 1999-2018 period, average length of stay for Medicare patients declined from 6.0 days to 5.2 days and Medicaid patients stayed similar (4.5 days to 4.6 days).[2]

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

Change in length of hospital stay

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

In addition, a published report from the OIG has documented significant decreases in length of stay and that hospitals are billing the highest severity DRGs more frequently.

The OIG stated:
"Hospitals are increasingly billing for inpatient stays at the highest severity level, which is the most expensive one. The number of stays at the highest severity level increased almost 20 percent from FY 2014 through FY 2019, ultimately accounting for nearly half of all Medicare spending on inpatient hospital stays. The number of stays billed at each of the other severity levels decreased. At the same time, the average length of stay decreased for stays at the highest severity level, while the average length of all stays remained largely the same."

While this OIG article suggests that providers may be upcoding, the expert panels' experience suggest that the trend supports the fact that physicians/QHPs are caring for patients who have many more contributing conditions and increased pressure to get the patient on to the next level of care outside the acute care setting of the inpatient stay. This requires more intense and complex work in a shorter period of time.

Change in Technology

Outpatient EHRs are significantly different from inpatient EHRs. Some of the most obvious differences are requirements for pharmacy potential interactions to be overridden by the physician, as necessary. Additionally, flags are frequently popping up as they are put in place for safety reasons, however, these flags require physician/QHP rather than clinical staff to review and override after decisions for treatments have been modified and thus requires the physician/QHP to go back to the EHR before the clinical staff can continue with care of the patient such as a medication change.

The American Hospital Association reported that in 2017[3] 95% of hospitals had some form of EHR implemented. This is significant change from 2006. As reported in 2006 by the Healthcare Financial Management Association, only 13% of hospitals had an EHR for health outcomes; 13% for clinical decision support; and 2% for patient access.

[3] SOURCE: ONC/American Hospital Association (AHA), AHA Annual Survey Information Technology Supplement: 2015-2017.

Data from the Chronic Conditions Data Warehouse also support our assertion that Medicare patients have increasing rates of comorbidities that in turn increase the complexity of hospitalizations. In addition to high prevalence of diabetes, hypertension and COPD among Medicare beneficiaries, there has been marked increase between 2010 and 2019 in rates of chronic kidney disease (15% to 26%), depression (14% to 19%) and rheumatoid arthritis/osteoarthritis (29% to 35%).

Change in Knowledge (new HOSPITALIST specialty provider type)

Hospitalists are a new specialty that was not fully organized as a specialty in 2006 when the codes were last surveyed and is a specialty that continues to grow. The term "hospitalist" was coined in 1996 to describe a trend of primary care physicians choosing to practice exclusively in the hospital[4] and the field began to organize in earnest in the early 2000s. Hospitalists are predominantly internal medicine trained, but there are also a significant number of hospitalists with the specialties of family medicine, pediatrics, and medical subspecialties. In 2011, there were 25,787 adult hospitalists identified using a 90% threshold of Medicare billing claims associated with hospitalizations.[5] In 2012, there were 28,473 hospitalists identified using a nearly identical 90% threshold.[6] New analyses using the same data and methodology suggest the field has continued to grow at a similar rate through 2019, with approximately 44,000 hospitalists identified.[7] This shows that the field continues to grow and the model and systems of care associated with hospitalists continues to spread. In 2006, the impact of hospitalists on the care of hospitalized patients would not have been as pronounced as it is today.

Hospitalist practice diverges from the model of outpatient primary care rounding in the hospital on their patients in several important ways. First, hospitalists provide 24-hour coverage of patients in the hospital using a shift-based model. Shifts are typically 12 (~64% of groups) or 10 (~20% of groups) hours long.[8] Shift-based coverage makes at least one handoff between physicians during a 24-hour period ubiquitous. About 50% of hospitalist groups use a daytime admitter model or a hybrid for admissions,[9] meaning patients who enter the hospital overnight are admitted by one clinician and then dedicated staff the following morning continue the care. These handoffs make assessments of time spent with the patient on a calendar day difficult, but reflect the reality of team-based care in many hospitals.

Finally, using 90% threshold-identified hospitalists to examine trends in Medicare billing data shows that, in 2019, hospitalists are billing the plurality of charges for nearly all of the hospital visit E/M codes. For example, in 2019, hospitalists accounted for 10.2% of 99221, 15.1% of 99222 and 31.9% of 99223 of the total volume of Medicare bills for each of these codes.[10]

We concede that the existing data in the RUC database attributes a much smaller proportion of billing claims to hospitalists as this includes only the small proportion of hospitalists who voluntarily identified in PECOS using a recently established Medicare specialty billing code (C6). However, given the demonstrated growth in the number of hospitalists, the 2006 valuations reflected a provider mix that is no longer representative of the healthcare system today. Therefore we believe this meets the CE criteria for shift to another specialty with different knowledge base.

Survey Analysis

The specialty societies discussed that the work RVUs for the initial inpatient/observation codes, the discharge codes, and the same day admission/discharge codes must be in proper rank order to each other (and to the office visit codes). Similarly, the subsequent inpatient/observation visit codes must be in proper rank order to the initial visit codes and comparable office visit codes.

Note: The sample consists of 3,599 non-federal acute care hospitals. "There was a 7 percent increase between 2015 and 2016 in the percent of hospitals that use their EHR data." ONC Data Brief ■ No. 46■ April 2019

As a threshold matter, the expert panel reviewed the intensity/complexity measures for all the codes. For virtually all the codes, well over 50% of respondents reported that the intensity and complexity of these services was somewhat, or much more than the reference services which were mostly office visits. This confirmed the panel's understanding that inpatient visits are more intense the outpatient office visits.

99233 Review and Recommendations

There were 258 respondents of whom 97% found the vignette to be typical. The survey times and median RVW were 0/52/0/52/2.90 and the 25th percentile RVW was 2.40.

The previous survey data was: 107 respondents (to the revised vignette) of whom 96% found the vignette to be typical. The survey times and median work RVU were 0/40/0/40/3.00. The survey 25th percentile work RVU was 2.66.

The current times and work RVU are 10/30/15/55/2.00.

The key reference services were 99215, *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter*, with times and work RVU of 10/45/15/70/2.80, and 99214, *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter*, with times and work RVU of 7/30/10/47/1.92.

The key reference services for the previous survey were 99215 and 99205.

The expert panel noted that the survey time of 52 minutes is 5 minutes more than the total time for 99214 but that the level of MDM for 99233 is high while that for 99214 is moderate. 99215 has the same level of MDM as 99233 (high) but has 18 more minutes of time.

Given the higher intensity of inpatient care, the expert panel agreed that the survey 25th percentile RVW of 2.40 placed 99233 in proper rank order to both key reference services.
The panel also noted that the survey time of 52 minutes is 44% higher than the survey time for 99232 and the 25th percentile work RVU of 2.40 is appropriately 50% higher than the recommended work RVU for 99232 (1.59).

Therefore, the expert panel recommends the survey intra/total time of 52 minutes and the survey 25th percentile work RVU of 2.40 to account for increased intensity and complexity of work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99233, 99226

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Internal Medicine How often? Commonly

Specialty Hospitalist How often? Commonly

Specialty Pulmonary Disease How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 74874021
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We anticipate 3 times the annual Medicare utilization; based on 2019 utilization data.

Specialty Internal Medicine Frequency 24051911 Percentage 32.12 %

Specialty Hospitalist Frequency 7899071 Percentage 10.54 %

Specialty Pulmonary Disease Frequency 5905847 Percentage 7.88 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 24,958,007 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2019 Medicare utilization from the RUC database.

Specialty Internal Medicine Frequency 8017304 Percentage 32.12 %

Specialty Hospitalist Frequency 2633024 Percentage 10.54 %

Specialty Pulmonary Disease Frequency 1968616 Percentage 7.88 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Hospital visit

BETOS Sub-classification Level II:
Subsequent

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99223

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

SUMMARY OF RECOMMENDATION

CPT Code:99234 Tracking Number F7 Original Specialty Recommended RVU: **2.56**
Presented Recommended RVU: **2.00**
Global Period: XXX Current Work RVU: **2.56** RUC Recommended RVU: **2.00**

CPT Descriptor: Hospital inpatient or observation care, for the evaluation and management of a patient including admission and discharge on the same date, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with an acute, uncomplicated illness or injury is admitted for either initial inpatient or observation care services. The patient is discharged later that same day.
(This service includes two or more encounters on the same date of which one of these encounters is an initial admission encounter and another encounter being a discharge encounter.)

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Review available prior medical records and data, place requests for other records and data as necessary for the new patient visit/obs/admission service. Coordinate with other members of the health care team regarding the obs/admission service. Visit patient location (e.g., floor, observation area, unit) confirm patient's identity. Review the medical history with the patient and/or family/caregiver. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan (requiring straightforward or low medical decision making [MDM]). Consider discharge needs of patient. Discuss the treatment plan with patient and family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write and/or review observation or inpatient admission orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Document the encounters throughout the calendar day in the medical record. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family and/or caregivers throughout the calendar day. Provide care coordination for the transition, including instructions to caregivers for aftercare. Arrange for post-discharge follow-up professional services and testing. Reconcile patient's medications with attention to pre-admission therapy, observation therapy, and outpatient formulary; write prescriptions as necessary. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver that may occur within the calendar day, prior to discharge, respond to treatment failures during the admission.

Description of Post-Service Work: Complete discharge records. Respond and attend to any treatment failures, negative outcomes, medication refill requests, or adverse medication reactions that may occur after discharge until the primary care physician assumes care. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management related to this facility stay. Receive and respond to any interval testing results or correspondence,

including obtaining results pending at discharge, until the primary care physician assumes care. Revise treatment plan(s) and communicate with patient and/or caregiver, as necessary, until the primary care physician assumes care.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	65%	29%	6%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	18%	47%	35%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	88%	6%
Physical effort required	6%	59%	35%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	6%	53%	41%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	7%	22%	57%	14%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	43%	50%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	7%	43%	50%
Physical effort required	7%	50%	43%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	29%	71%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In February 2021, the CPT Editorial Panel deleted seven observation care codes and revised eleven codes to merge inpatient and observation care and to align with the principles included in the office or other outpatient E/M services (99202-99215) by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visit codes, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of an inpatient hospital or observation care visit code, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing and managing the patient are summed to select the appropriate code. The inpatient and observation care services were surveyed for the October 2021 RUC meeting. The survey time captured the total time on the date of encounter by calendar date. All the codes were surveyed in June/July and discussed at length for the October 2021 RUC meeting as well as several pre facilitation meetings.

In October 2021, the RUC referred these services to be resurveyed because the survey did not include a request for distinct time before and after floor/unit time, therefore could not be compared to previous RUC surveys of these services.

The Inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) were surveyed again by the specialty societies with the research approved revised survey tool. The survey societies sent out the survey randomly to members in November 2021 for presentation at the January 2022 RUC meeting.

The surveying societies were:
American Academy of Hospice and Palliative Medicine
American Academy of Neurology
American Association of Neurological Surgeons/Congress of Neurological Surgeons
American Academy of Orthopaedic Surgeons
American Academy of Pediatrics
American Association for Thoracic Surgery
American College of Cardiology
American College of Chest Physicians
American College of Obstetricians and Gynecologists
American College of Physicians
American College of Surgeons
American Geriatrics Society
American Nurses Association
American Society of Clinical Oncology
American Society of Colon and Rectal Surgeons
American Society for Surgery of the Hand
American Thoracic Society
Infectious Diseases Society of America
North American Spine Society
Society of Hospital Medicine
Society of Thoracic Surgeons
Society for Vascular Surgery

Details of the Research Approved Revised Survey Tool for inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) at the January 2021 RUC meeting

As discussed at the October 2021 RUC meeting, the specialty societies believed that the intraservice time data was flawed. The societies believed that some respondents may have only been considering floor/unit time and not the time before or after floor/unit time on the date of encounter. The RUC agreed with the specialty societies to resurvey the inpatient and observation E/M services, after revision of the survey tool to include definitions of time before and after floor/unit time. This would allow better comparison to prior surveys that included these time components. It should be noted that although the revised survey tool included a worksheet question asking for separate on/off floor times on the date of service, this question was followed by a question that included the summed total time for respondent confirmation that the total time was accurate. If the respondent did not agree with the total time for one or more of the codes as arrayed, then the respondent was asked to return to the worksheet question and adjust the times as needed. The respondent could not move forward in the survey before affirming that the total times on the date of encounter were accurate. This total time confirmation is important because the joint societies believe the correct analysis is to use the total time as confirmed by the survey respondent. Both survey tools are included in the RUC materials. We note that the total time presented in our SoRs and in our RUC summary materials are the statistics of the total time as calculated in the survey tool and verified by the survey respondent. For full transparency, additional details on the survey tool questions and responses is provided in a separate informational file.

Compelling Evidence

We believe we meet several compelling evidence criteria

1.) Documentation by "Other reliable data" for change in physician work
   a. *Change in patient population*
   b. *Change in length of hospital stay*
   c. *Change in Technology*
   d. *Change in Knowledge (new provider type)*

Documentation by Other reliable data

Our compelling evidence is based on four types of changes: a.) patient population; b.) reduced length of stay; c.) change in technology (inpatient EHRs); and d.) change in knowledge (new provider type). We believe each of these meet the criteria for "***other reliable data.***"

Change in patient population

The number of diagnoses that appear in the Medicare claims for Inpatient Visits (based on the 5% file) has increased over the years since these codes were last reviewed. The largest changes are occurring at the higher-level services. Since 2006 the number of diagnoses has increased by more than 30% for all the codes except 99221 and 99222 which have gone up 25%. For example, for 99223 the number has increased by 31% and for 99233, the increase is 41%.

Our experts are experiencing more complicated patients, with more clinical indications to review and consider, while balancing moving these more complicated patients to the next setting of care, such as a SNF. The chart below supports the fact that patients at higher level codes have more indications to consider in decision making and physicians/QHP caring for these patients are being asked to move those patients along to the next level of care and shorter LOS.

CPT Code	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	Percentage Change

The demographics of hospitalized patients continue to change over time, particularly as payors and patients apply pressure to provide care in the lowest, safest acuity setting. Medicare and Medicaid patients continue to grow as a proportion of inpatient stays. In 1999, Medicare patients made up 35.9% of inpatients and Medicaid patients, 16.6%. By 2018, these proportions increased significantly: Medicare (40.9%) and Medicaid (22.7%).[1] This shift was almost entirely accounted for by decrease in inpatients with private insurance, while overall number of hospitalizations nationwide remained relatively constant. Over the

[1] Agency for Healthcare Research and Quality (AHRQ). HCUP Fast Stats—Trends in Inpatient Stays. Accessed November 29, 2021, via https://www.hcup-us.ahrq.gov/faststats/NationalTrendsServlet/

same 1999-2018 period, average length of stay for Medicare patients declined from 6.0 days to 5.2 days and Medicaid patients stayed similar (4.5 days to 4.6 days).[2]

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

Change in length of hospital stay

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

In addition, a published report from the OIG has documented significant decreases in length of stay and that hospitals are billing the highest severity DRGs more frequently.

The OIG stated:
"Hospitals are increasingly billing for inpatient stays at the highest severity level, which is the most expensive one. The number of stays at the highest severity level increased almost 20 percent from FY 2014 through FY 2019, ultimately accounting for nearly half of all Medicare spending on inpatient hospital stays. The number of stays billed at each of the other severity levels decreased. At the same time, the average length of stay decreased for stays at the highest severity level, while the average length of all stays remained largely the same."

While this OIG article suggests that providers may be upcoding, the expert panels' experience suggest that the trend supports the fact that physicians/QHPs are caring for patients who have many more contributing conditions and increased pressure to get the patient on to the next level of care outside the acute care setting of the inpatient stay. This requires more intense and complex work in a shorter period of time.

Change in Technology

Outpatient EHRs are significantly different from inpatient EHRs. Some of the most obvious differences are requirements for pharmacy potential interactions to be overridden by the physician, as necessary. Additionally, flags are frequently popping up as they are put in place for safety reasons, however, these flags require physician/QHP rather than clinical staff to review and override after decisions for treatments have been modified and thus requires the physician/QHP to go back to the EHR before the clinical staff can continue with care of the patient such as a medication change.

The American Hospital Association reported that in 2017[3] 95% of hospitals had some form of EHR implemented. This is significant change from 2006. As reported in 2006 by the Healthcare Financial Management Association, only 13% of hospitals had an EHR for health outcomes; 13% for clinical decision support; and 2% for patient access.

[3] SOURCE: ONC/American Hospital Association (AHA), AHA Annual Survey Information Technology Supplement: 2015-2017.

Data from the Chronic Conditions Data Warehouse also support our assertion that Medicare patients have increasing rates of comorbidities that in turn increase the complexity of hospitalizations. In addition to high prevalence of diabetes, hypertension and COPD among Medicare beneficiaries, there has been marked increase between 2010 and 2019 in rates of chronic kidney disease (15% to 26%), depression (14% to 19%) and rheumatoid arthritis/osteoarthritis (29% to 35%).

Change in Knowledge (new HOSPITALIST specialty provider type)

Hospitalists are a new specialty that was not fully organized as a specialty in 2006 when the codes were last surveyed and is a specialty that continues to grow. The term "hospitalist" was coined in 1996 to describe a trend of primary care physicians choosing to practice exclusively in the hospital[4] and the field began to organize in earnest in the early 2000s. Hospitalists are predominantly internal medicine trained, but there are also a significant number of hospitalists with the specialties of family medicine, pediatrics, and medical subspecialties. In 2011, there were 25,787 adult hospitalists identified using a 90% threshold of Medicare billing claims associated with hospitalizations.[5] In 2012, there were 28,473 hospitalists identified using a nearly identical 90% threshold.[6] New analyses using the same data and methodology suggest the field has continued to grow at a similar rate through 2019, with approximately 44,000 hospitalists identified.[7] This shows that the field continues to grow and the model and systems of care associated with hospitalists continues to spread. In 2006, the impact of hospitalists on the care of hospitalized patients would not have been as pronounced as it is today.

Hospitalist practice diverges from the model of outpatient primary care rounding in the hospital on their patients in several important ways. First, hospitalists provide 24-hour coverage of patients in the hospital using a shift-based model. Shifts are typically 12 (~64% of groups) or 10 (~20% of groups) hours long.[8] Shift-based coverage makes at least one handoff between physicians during a 24-hour period ubiquitous. About 50% of hospitalist groups use a daytime admitter model or a hybrid for admissions,[9] meaning patients who enter the hospital overnight are admitted by one clinician and then dedicated staff the following morning continue the care. These handoffs make assessments of time spent with the patient on a calendar day difficult, but reflect the reality of team-based care in many hospitals.

Finally, using 90% threshold-identified hospitalists to examine trends in Medicare billing data shows that, in 2019, hospitalists are billing the plurality of charges for nearly all of the hospital visit E/M codes. For example, in 2019, hospitalists accounted for 10.2% of 99221, 15.1% of 99222 and 31.9% of 99223 of the total volume of Medicare bills for each of these codes.[10]

We concede that the existing data in the RUC database attributes a much smaller proportion of billing claims to hospitalists as this includes only the small proportion of hospitalists who voluntarily identified in PECOS using a recently established Medicare specialty billing code (C6). However, given the demonstrated growth in the number of hospitalists, the 2006 valuations reflected a provider mix that is no longer representative of the healthcare system today. Therefore we believe this meets the CE criteria for shift to another specialty with different knowledge base.

Survey Analysis

The specialty societies discussed that the work RVUs for the initial inpatient/observation codes, the discharge codes, and the same day admission/discharge codes must be in proper rank order to each other (and to the office visit codes). Similarly, the subsequent inpatient/observation visit codes must be in proper rank order to the initial visit codes and comparable office visit codes.

Note: The sample consists of 3,599 non-federal acute care hospitals. "There was a 7 percent increase between 2015 and 2016 in the percent of hospitals that use their EHR data." ONC Data Brief ■ No. 46■ April 2019

As a threshold matter, the expert panel reviewed the intensity/complexity measures for all the codes. For virtually all the codes, well over 50% of respondents reported that the intensity and complexity of these services was somewhat, or much more than the reference services which were mostly office visits. This confirmed the panel's understanding that inpatient visits are more intense the outpatient office visits.

99234 Review and Recommendations

There were 58 respondents of whom 90% found the vignette to be typical. The survey times and median RVW were 0/45/5/50/2.6 and the 25th percentile RVW was 2.00
The previous survey data was: 74 respondents of whom 92% found the vignette to be typical. The survey times and work RVU were 0/34/0/34/1.92. The 25th percentile work RVU was 1.56.

The current times and work RVU are 14/40/15/69/2.56

The key reference services were 99203, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter, with times and work RVU of 5/25/5/35/1.60, and 99204, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter, with times and work RVU of 10/40/10/2.60.

These were the same key reference services as the previous survey.

The expert panel noted that the survey time for 99234 (50) is 15 minutes more than that of 99203 (42% more) and that time difference is best reflected by the current RVW which is 60% more than that of 99203.

Because 99234 includes the work of admission and discharge, the expert panel agreed that the current RVW of 2.56 placed it in proper rank order with the key reference services. It reflects the higher intensity of hospital care and the added work of the discharge.

The expert panel noted that with respect to 99204, the survey time for 99234 is only 10 minutes less and that because hospital care is more intense the survey 25th percentile of 2.00 is too low and would create a rank order anomaly.

Therefore, the expert panel recommends the survey intra 45 minutes, post time 5 minutes /total time of 50 minutes and the current RVW of 2.56.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99234

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Internal Medicine How often? Sometimes

Specialty Family Medicine How often? Sometimes

Specialty Emergency Medicine How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 101271
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We anticipate 3 times the annual Medicare utilization; based on 2019 utilization data.

Specialty Internal Medicine Frequency 29976 Percentage 29.59 %

Specialty Family Medicine Frequency 12963 Percentage 12.80 %

Specialty Emergency Medicine Frequency 7798 Percentage 7.70 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 33,757
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2019 Medicare utilization from the RUC database.

Specialty Internal Medicine Frequency 9992 Percentage 29.59 %

Specialty Family Medicine Frequency 4321 Percentage 12.80 %

Specialty Emergency Medicine Frequency 2599 Percentage 7.69 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Hospital visit

BETOS Sub-classification Level II:

Initial

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99234

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99235 Tracking Number F8 Original Specialty Recommended RVU: **3.24**
Presented Recommended RVU: **3.24**
Global Period: XXX Current Work RVU: **3.24** RUC Recommended RVU: **3.24**

CPT Descriptor: Hospital inpatient or observation care, for the evaluation and management of a patient including admission and discharge on the same date, which requires a medically appropriate history and/or examination and moderate level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with an acute illness with systemic symptoms or a patient with an acute complicated injury that requires medical management or potential surgical treatment is admitted for either initial inpatient or observation care services. The patient is discharged later that same day. (This service includes two or more encounters on the same date of which one of these encounters is an initial admission encounter and another encounter being a discharge encounter.)

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Review available prior medical records and data, place requests for other records and data as necessary for the new patient visit/obs/admission service. Coordinate with other members of the health care team regarding the obs/admission service. Visit patient location (e.g., floor, observation area, unit) confirm patient's identity. Review the medical history with the patient and/or family/caregiver. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan (requiring moderate medical decision making [MDM]). Consider discharge needs of patient. Discuss the treatment plan with patient and family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write and/or review observation or inpatient admission orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Document the encounters throughout the calendar day in the medical record. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family and/or caregivers throughout the calendar day. Provide care coordination for the transition, including instructions to caregivers for aftercare. Arrange for post-discharge follow-up professional services and testing. Reconcile patient's medications with attention to pre-admission therapy, observation therapy, and outpatient formulary; write prescriptions as necessary. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver that may occur within the calendar day, prior to discharge, respond to treatment failures during the admission

Description of Post-Service Work: Complete discharge records. Respond and attend to any treatment failures, negative outcomes, medication refill requests, or adverse medication reactions that may occur after discharge until the primary care physician assumes care. Provide necessary care coordination, telephonic or electronic communication assistance, and other

necessary management related to this facility stay. Receive and respond to any interval testing results or correspondence, including obtaining results pending at discharge, until the primary care physician assumes care. Revise treatment plan(s) and communicate with patient and/or caregiver, as necessary, until the primary care physician assumes care.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	23%	59%	18%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	9%	32%	59%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	68%	27%
Physical effort required	0%	36%	64%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	32%	68%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	5%	0%	11%	58%	26%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	21%	21%	58%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	37%	58%
Physical effort required	5%	47%	48%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	26%	74%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In February 2021, the CPT Editorial Panel deleted seven observation care codes and revised eleven codes to merge inpatient and observation care and to align with the principles included in the office or other outpatient E/M services (99202-99215) by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visit codes, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of an inpatient hospital or observation care visit code, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing and managing the patient are summed to select the appropriate code. The inpatient and observation care services were surveyed for the October 2021 RUC meeting. The survey time captured the total time on the date of encounter by calendar date. All the codes were surveyed in June/July and discussed at length for the October 2021 RUC meeting as well as several pre facilitation meetings.

In October 2021, the RUC referred these services to be resurveyed because the survey did not include a request for distinct time before and after floor/unit time, therefore could not be compared to previous RUC surveys of these services.

The Inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) were surveyed again by the specialty societies with the research approved revised survey tool. The survey societies sent out the survey randomly to members in November 2021 for presentation at the January 2022 RUC meeting.

The surveying societies were:
American Academy of Hospice and Palliative Medicine
American Academy of Neurology
American Association of Neurological Surgeons/Congress of Neurological Surgeons
American Academy of Orthopaedic Surgeons
American Academy of Pediatrics
American Association for Thoracic Surgery
American College of Cardiology
American College of Chest Physicians

Society for Vascular Surgery

Details of the Research Approved Revised Survey Tool for inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) at the January 2021 RUC meeting

As discussed at the October 2021 RUC meeting, the specialty societies believed that the intraservice time data was flawed. The societies believed that some respondents may have only been considering floor/unit time and not the time before or after floor/unit time on the date of encounter. The RUC agreed with the specialty societies to resurvey the inpatient and observation E/M services, after revision of the survey tool to include definitions of time before and after floor/unit time. This would allow better comparison to prior surveys that included these time components. It should be noted that although the revised survey tool included a worksheet question asking for separate on/off floor times on the date of service, this question was followed by a question that included the summed total time for respondent confirmation that the total time was accurate. If the respondent did not agree with the total time for one or more of the codes as arrayed, then the respondent was asked to return to the worksheet question and adjust the times as needed. The respondent could not move forward in the survey before affirming that the total

times on the date of encounter were accurate. This total time confirmation is important because the joint societies believe the correct analysis is to use the total time as confirmed by the survey respondent. Both survey tools are included in the RUC materials. We note that the total time presented in our SoRs and in our RUC summary materials are the statistics of the total time as calculated in the survey tool and verified by the survey respondent. For full transparency, additional details on the survey tool questions and responses is provided in a separate informational file.

Compelling Evidence

We believe we meet several compelling evidence criteria

1.) Documentation by "Other reliable data" for change in physician work
   a. *Change in patient population*
   b. *Change in length of hospital stay*
   c. *Change in Technology*
   d. *Change in Knowledge (new provider type)*

Documentation by Other reliable data

Our compelling evidence is based on four types of changes: a.) patient population; b.) reduced length of stay; c.) change in technology (inpatient EHRs); and d.) change in knowledge (new provider type). We believe each of these meet the criteria for "***other reliable data.***"

Change in patient population

The number of diagnoses that appear in the Medicare claims for Inpatient Visits (based on the 5% file) has increased over the years since these codes were last reviewed. The largest changes are occurring at the higher-level services. Since 2006 the number of diagnoses has increased by more than 30% for all the codes except 99221 and 99222 which have gone up 25%. For example, for 99223 the number has increased by 31% and for 99233, the increase is 41%.

Our experts are experiencing more complicated patients, with more clinical indications to review and consider, while balancing moving these more complicated patients to the next setting of care, such as a SNF. The chart below supports the fact that patients at higher level codes have more indications to consider in decision making and physicians/QHP caring for these patients are being asked to move those patients along to the next level of care and shorter LOS.

CPT Code	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	Percentage Change

The demographics of hospitalized patients continue to change over time, particularly as payors and patients apply pressure to provide care in the lowest, safest acuity setting. Medicare and Medicaid patients continue to grow as a proportion of inpatient stays. In 1999, Medicare patients made up 35.9% of inpatients and Medicaid patients, 16.6%. By 2018, these proportions increased significantly: Medicare (40.9%) and Medicaid (22.7%).[1] This shift was almost entirely accounted for by decrease in

[1] Agency for Healthcare Research and Quality (AHRQ). HCUP Fast Stats—Trends in Inpatient Stays. Accessed November 29, 2021, via https://www.hcup-us.ahrq.gov/faststats/NationalTrendsServlet/

inpatients with private insurance, while overall number of hospitalizations nationwide remained relatively constant. Over the same 1999-2018 period, average length of stay for Medicare patients declined from 6.0 days to 5.2 days and Medicaid patients stayed similar (4.5 days to 4.6 days).[2]

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

Change in length of hospital stay

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

In addition, a published report from the OIG has documented significant decreases in length of stay and that hospitals are billing the highest severity DRGs more frequently.

The OIG stated:
"Hospitals are increasingly billing for inpatient stays at the highest severity level, which is the most expensive one. The number of stays at the highest severity level increased almost 20 percent from FY 2014 through FY 2019, ultimately accounting for nearly half of all Medicare spending on inpatient hospital stays. The number of stays billed at each of the other severity levels decreased. At the same time, the average length of stay decreased for stays at the highest severity level, while the average length of all stays remained largely the same."

While this OIG article suggests that providers may be upcoding, the expert panels' experience suggest that the trend supports the fact that physicians/QHPs are caring for patients who have many more contributing conditions and increased pressure to get the patient on to the next level of care outside the acute care setting of the inpatient stay. This requires more intense and complex work in a shorter period of time.

Change in Technology

Outpatient EHRs are significantly different from inpatient EHRs. Some of the most obvious differences are requirements for pharmacy potential interactions to be overridden by the physician, as necessary. Additionally, flags are frequently popping up as they are put in place for safety reasons, however, these flags require physician/QHP rather than clinical staff to review and override after decisions for treatments have been modified and thus requires the physician/QHP to go back to the EHR before the clinical staff can continue with care of the patient such as a medication change.

The American Hospital Association reported that in 2017[3] 95% of hospitals had some form of EHR implemented. This is significant change from 2006. As reported in 2006 by the Healthcare Financial Management Association, only 13% of hospitals had an EHR for health outcomes; 13% for clinical decision support; and 2% for patient access.

---

Data from the Chronic Conditions Data Warehouse also support our assertion that Medicare patients have increasing rates of comorbidities that in turn increase the complexity of hospitalizations. In addition to high prevalence of diabetes, hypertension and COPD among Medicare beneficiaries, there has been marked increase between 2010 and 2019 in rates of chronic kidney disease (15% to 26%), depression (14% to 19%) and rheumatoid arthritis/osteoarthritis (29% to 35%).

Change in Knowledge (new HOSPITALIST specialty provider type)

Hospitalists are a new specialty that was not fully organized as a specialty in 2006 when the codes were last surveyed and is a specialty that continues to grow. The term "hospitalist" was coined in 1996 to describe a trend of primary care physicians choosing to practice exclusively in the hospital[4] and the field began to organize in earnest in the early 2000s. Hospitalists are predominantly internal medicine trained, but there are also a significant number of hospitalists with the specialties of family medicine, pediatrics, and medical subspecialties. In 2011, there were 25,787 adult hospitalists identified using a 90% threshold of Medicare billing claims associated with hospitalizations.[5] In 2012, there were 28,473 hospitalists identified using a nearly identical 90% threshold.[6] New analyses using the same data and methodology suggest the field has continued to grow at a similar rate through 2019, with approximately 44,000 hospitalists identified.[7] This shows that the field continues to grow and the model and systems of care associated with hospitalists continues to spread. In 2006, the impact of hospitalists on the care of hospitalized patients would not have been as pronounced as it is today.

Hospitalist practice diverges from the model of outpatient primary care rounding in the hospital on their patients in several important ways. First, hospitalists provide 24-hour coverage of patients in the hospital using a shift-based model. Shifts are typically 12 (~64% of groups) or 10 (~20% of groups) hours long.[8] Shift-based coverage makes at least one handoff between physicians during a 24-hour period ubiquitous. About 50% of hospitalist groups use a daytime admitter model or a hybrid for admissions,[9] meaning patients who enter the hospital overnight are admitted by one clinician and then dedicated staff the following morning continue the care. These handoffs make assessments of time spent with the patient on a calendar day difficult, but reflect the reality of team-based care in many hospitals.

Finally, using 90% threshold-identified hospitalists to examine trends in Medicare billing data shows that, in 2019, hospitalists are billing the plurality of charges for nearly all of the hospital visit E/M codes. For example, in 2019, hospitalists accounted for 10.2% of 99221, 15.1% of 99222 and 31.9% of 99223 of the total volume of Medicare bills for each of these codes.[10]

We concede that the existing data in the RUC database attributes a much smaller proportion of billing claims to hospitalists as this includes only the small proportion of hospitalists who voluntarily identified in PECOS using a recently established Medicare specialty billing code (C6). However, given the demonstrated growth in the number of hospitalists, the 2006 valuations reflected a provider mix that is no longer representative of the healthcare system today. Therefore we believe this meets the CE criteria for shift to another specialty with different knowledge base.

Survey Analysis

The specialty societies discussed that the work RVUs for the initial inpatient/observation codes, the discharge codes, and the same day admission/discharge codes must be in proper rank order to each other (and to the office visit codes). Similarly, the

subsequent inpatient/observation visit codes must be in proper rank order to the initial visit codes and comparable office visit codes.

As a threshold matter, the expert panel reviewed the intensity/complexity measures for all the codes. For virtually all the codes, well over 50% of respondents reported that the intensity and complexity of these services was somewhat, or much more than the reference services which were mostly office visits. This confirmed the panel's understanding that inpatient visits are more intense the outpatient office visits.

99235 Review and Recommendations

There were 59 respondents of whom 92% found the vignette to be typical. The survey times and median RVW were 0/68/8/76/3.50 and the 25th percentile RVW was 2.88.

The previous survey data were: 79 respondents of whom 92% found the vignette typical. The survey times and median work RVU were 0/45/0/45/2.75. The 25th percentile work RVU was 2.10.

The current times and work RVU are 14/50/19.5/83.5/3.24.

The key reference services were 99204, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter, with times and work RVU of 10/40/10/60/2.60, and 99205, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter, with times and work RVU of 14/59/15/88/3.50.

These are the same key reference services as for the previous survey.

The time of 76 minutes is 16 minutes more than that of key reference service 99204 which has the same level of MDM (moderate). Further, the survey 25th percentile RVW of 2.88 does not reflect the increased time of 99235 and would create a rank order anomaly.

Given the higher intensity of hospital care and the added work of discharge, the expert panel agreed that the current RVW of 3.24 places 99235 in proper rank order to the key reference services.

It also ranks 99235 in proper order to 99234. 99235 has 52% more time (76 vs. 50) and the current RVW of 3.24 is 26% more than the current RVW for 99234.

Therefore, the expert panel recommends the survey intra 68 minutes, post time 8 minutes/total time of 76 minutes and the current RVW of 3.24.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99235

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Internal Medicine How often? Sometimes

Specialty Family Medicine How often? Sometimes

Specialty Hospitalist How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 271197
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We anticipate 3 times the annual Medicare utilization; based on 2019 utilization data.

Specialty Internal Medicine Frequency 113360 Percentage 41.79 %

Specialty Family Medicine Frequency 45019 Percentage 16.60 %

Specialty Hospitalist Frequency 32272 Percentage 11.89 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 90,399
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2019 Medicare utilization from the RUC database.

Specialty Internal Medicine Frequency 37787 Percentage 41.80 %

Specialty Family Medicine Frequency 15006 Percentage 16.59 %

Specialty Hospitalist Frequency 10757 Percentage 11.89 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Hospital visit

BETOS Sub-classification Level II:
Initial

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99235

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99236 Tracking Number F9 Original Specialty Recommended RVU: **4.30**
Presented Recommended RVU: **4.30**
Global Period: XXX Current Work RVU: **4.20** RUC Recommended RVU: **4.30**

CPT Descriptor: Hospital inpatient or observation care, for the evaluation and management of a patient including admission and discharge on the same date, which requires a medically appropriate history and/or examination and high level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with a severe exacerbation of a chronic illness or an acute illness/injury that poses a threat to life or bodily function is admitted for either initial inpatient or observation care services. The patient is discharged later that same day. (This service includes two or more encounters on the same date of which one of these encounters is an initial admission encounter and another encounter being a discharge encounter.)

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Review available prior medical records and data, place requests for other records and data as necessary for the new patient visit/obs/admission service. Coordinate with other members of the health care team regarding the obs/admission service. Visit patient location (e.g., floor, observation area, unit) confirm patient's identity. Review the medical history with the patient and/or family/caregiver. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan (requiring high medical decision making [MDM]). Consider discharge needs of patient. Discuss the treatment plan with patient and family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write and/or review observation or inpatient admission orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Document the encounters throughout the calendar day in the medical record. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family and/or caregivers throughout the calendar day. Provide care coordination for the transition, including instructions to caregivers for aftercare. Arrange for post-discharge follow-up professional services and testing. Reconcile patient's medications with attention to pre-admission therapy, observation therapy, and outpatient formulary; write prescriptions as necessary. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver that may occur within the calendar day, prior to discharge, respond to treatment failures during the admission

Description of Post-Service Work: Complete discharge records. Respond and attend to any treatment failures, negative outcomes, medication refill requests, or adverse medication reactions that may occur after discharge until the primary care physician assumes care. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management related to this facility stay. Receive and respond to any interval testing results or correspondence,

including obtaining results pending at discharge, until the primary care physician assumes care. Revise treatment plan(s) and communicate with patient and/or caregiver, as necessary, until the primary care physician assumes care.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	4%	0%	11%	27%	58%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	4%	27%	69%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	4%	35%	61%

Physical effort required	0%	50%	50%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	23%	77%

Survey Code Compared to 2nd Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	12%	53%	23%	12%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	18%	47%	35%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	24%	47%	29%
Physical effort required	6%	59%	35%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	12%	41%	47%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In February 2021, the CPT Editorial Panel deleted seven observation care codes and revised eleven codes to merge inpatient and observation care and to align with the principles included in the office or other outpatient E/M services (99202-99215) by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visit codes, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of an inpatient hospital or observation care visit code, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing and managing the patient are summed to select the appropriate code. The inpatient and observation care services were surveyed for the October 2021 RUC meeting. The survey time captured the total time on the date of encounter by calendar date. All the codes were surveyed in June/July and discussed at length for the October 2021 RUC meeting as well as several pre facilitation meetings.

In October 2021, the RUC referred these services to be resurveyed because the survey did not include a request for distinct time before and after floor/unit time, therefore could not be compared to previous RUC surveys of these services.

The Inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) were surveyed again by the specialty societies with the research approved revised survey tool. The survey societies sent out the survey randomly to members in November 2021 for presentation at the January 2022 RUC meeting.

The surveying societies were:
American Academy of Hospice and Palliative Medicine
American Academy of Neurology
American Association of Neurological Surgeons/Congress of Neurological Surgeons
American Academy of Orthopaedic Surgeons
American Academy of Pediatrics
American Association for Thoracic Surgery
American College of Cardiology
American College of Chest Physicians
American College of Obstetricians and Gynecologists
American College of Physicians
American College of Surgeons
American Geriatrics Society
American Nurses Association
American Society of Clinical Oncology
American Society of Colon and Rectal Surgeons
American Society for Surgery of the Hand
American Thoracic Society
Infectious Diseases Society of America
North American Spine Society
Society of Hospital Medicine
Society of Thoracic Surgeons
Society for Vascular Surgery

Details of the Research Approved Revised Survey Tool for inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) at the January 2021 RUC meeting

As discussed at the October 2021 RUC meeting, the specialty societies believed that the intraservice time data was flawed. The societies believed that some respondents may have only been considering floor/unit time and not the time before or after floor/unit time on the date of encounter. The RUC agreed with the specialty societies to resurvey the inpatient and observation E/M services, after revision of the survey tool to include definitions of time before and after floor/unit time. This would allow better comparison to prior surveys that included these time components. It should be noted that although the revised survey tool included a worksheet question asking for separate on/off floor times on the date of service, this question was followed by a question that included the summed total time for respondent confirmation that the total time was accurate. If the respondent did not agree with the total time for one or more of the codes as arrayed, then the respondent was asked to return to the worksheet question and adjust the times as needed. The respondent could not move forward in the survey before affirming that the total times on the date of encounter were accurate. This total time confirmation is important because the joint societies believe the correct analysis is to use the total time as confirmed by the survey respondent. Both survey tools are included in the RUC materials. We note that the total time presented in our SoRs and in our RUC summary materials are the statistics of the total time as calculated in the survey tool and verified by the survey respondent. For full transparency, additional details on the survey tool questions and responses is provided in a separate informational file.

Compelling Evidence

We believe we meet several compelling evidence criteria

1.) Documentation by "Other reliable data" for change in physician work
   a. *Change in patient population*
   b. *Change in length of hospital stay*
   c. *Change in Technology*
   d. *Change in Knowledge (new provider type)*

Documentation by Other reliable data

Our compelling evidence is based on four types of changes: a.) patient population; b.) reduced length of stay; c.) change in technology (inpatient EHRs); and d.) change in knowledge (new provider type). We believe each of these meet the criteria for "***other reliable data.***"

Change in patient population

The number of diagnoses that appear in the Medicare claims for Inpatient Visits (based on the 5% file) has increased over the years since these codes were last reviewed. The largest changes are occurring at the higher-level services. Since 2006 the number of diagnoses has increased by more than 30% for all the codes except 99221 and 99222 which have gone up 25%. For example, for 99223 the number has increased by 31% and for 99233, the increase is 41%.

Our experts are experiencing more complicated patients, with more clinical indications to review and consider, while balancing moving these more complicated patients to the next setting of care, such as a SNF. The chart below supports the fact that patients at higher level codes have more indications to consider in decision making and physicians/QHP caring for these patients are being asked to move those patients along to the next level of care and shorter LOS.

CPT Code	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	Percentage Change

The demographics of hospitalized patients continue to change over time, particularly as payors and patients apply pressure to provide care in the lowest, safest acuity setting. Medicare and Medicaid patients continue to grow as a proportion of inpatient stays. In 1999, Medicare patients made up 35.9% of inpatients and Medicaid patients, 16.6%. By 2018, these proportions increased significantly: Medicare (40.9%) and Medicaid (22.7%).[1] This shift was almost entirely accounted for by decrease in inpatients with private insurance, while overall number of hospitalizations nationwide remained relatively constant. Over the same 1999-2018 period, average length of stay for Medicare patients declined from 6.0 days to 5.2 days and Medicaid patients stayed similar (4.5 days to 4.6 days).[2]

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

Change in length of hospital stay

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

In addition, a published report from the OIG has documented significant decreases in length of stay and that hospitals are billing the highest severity DRGs more frequently.

The OIG stated:
"Hospitals are increasingly billing for inpatient stays at the highest severity level, which is the most expensive one. The number of stays at the highest severity level increased almost 20 percent from FY 2014 through FY 2019, ultimately accounting for nearly half of all Medicare spending on inpatient hospital stays. The number of stays billed at each of the other severity levels decreased. At the same time, the average length of stay decreased for stays at the highest severity level, while the average length of all stays remained largely the same."

While this OIG article suggests that providers may be upcoding, the expert panels' experience suggest that the trend supports the fact that physicians/QHPs are caring for patients who have many more contributing conditions and increased pressure to get the patient on to the next level of care outside the acute care setting of the inpatient stay. This requires more intense and complex work in a shorter period of time.

Change in Technology

Outpatient EHRs are significantly different from inpatient EHRs. Some of the most obvious differences are requirements for pharmacy potential interactions to be overridden by the physician, as necessary. Additionally, flags are frequently popping up as they are put in place for safety reasons, however, these flags require physician/QHP rather than clinical staff to review and override after decisions for treatments have been modified and thus requires the physician/QHP to go back to the EHR before the clinical staff can continue with care of the patient such as a medication change.

The American Hospital Association reported that in 2017[3] 95% of hospitals had some form of EHR implemented. This is significant change from 2006. As reported in 2006 by the Healthcare Financial Management Association, only 13% of hospitals had an EHR for health outcomes; 13% for clinical decision support; and 2% for patient access.

Data from the Chronic Conditions Data Warehouse also support our assertion that Medicare patients have increasing rates of comorbidities that in turn increase the complexity of hospitalizations. In addition to high prevalence of diabetes, hypertension and COPD among Medicare beneficiaries, there has been marked increase between 2010 and 2019 in rates of chronic kidney disease (15% to 26%), depression (14% to 19%) and rheumatoid arthritis/osteoarthritis (29% to 35%).

Change in Knowledge (new HOSPITALIST specialty provider type)

Hospitalists are a new specialty that was not fully organized as a specialty in 2006 when the codes were last surveyed and is a specialty that continues to grow. The term "hospitalist" was coined in 1996 to describe a trend of primary care physicians choosing to practice exclusively in the hospital[4] and the field began to organize in earnest in the early 2000s. Hospitalists are predominantly internal medicine trained, but there are also a significant number of hospitalists with the specialties of family medicine, pediatrics, and medical subspecialties. In 2011, there were 25,787 adult hospitalists identified using a 90% threshold of Medicare billing claims associated with hospitalizations.[5] In 2012, there were 28,473 hospitalists identified using a nearly identical 90% threshold.[6] New analyses using the same data and methodology suggest the field has continued to grow at a similar rate through 2019, with approximately 44,000 hospitalists identified.[7] This shows that the field continues to grow and the model and systems of care associated with hospitalists continues to spread. In 2006, the impact of hospitalists on the care of hospitalized patients would not have been as pronounced as it is today.

Hospitalist practice diverges from the model of outpatient primary care rounding in the hospital on their patients in several important ways. First, hospitalists provide 24-hour coverage of patients in the hospital using a shift-based model. Shifts are typically 12 (~64% of groups) or 10 (~20% of groups) hours long.[8] Shift-based coverage makes at least one handoff between physicians during a 24-hour period ubiquitous. About 50% of hospitalist groups use a daytime admitter model or a hybrid for admissions,[9] meaning patients who enter the hospital overnight are admitted by one clinician and then dedicated staff the following morning continue the care. These handoffs make assessments of time spent with the patient on a calendar day difficult, but reflect the reality of team-based care in many hospitals.

Finally, using 90% threshold-identified hospitalists to examine trends in Medicare billing data shows that, in 2019, hospitalists are billing the plurality of charges for nearly all of the hospital visit E/M codes. For example, in 2019, hospitalists accounted for 10.2% of 99221, 15.1% of 99222 and 31.9% of 99223 of the total volume of Medicare bills for each of these codes.[10]

We concede that the existing data in the RUC database attributes a much smaller proportion of billing claims to hospitalists as this includes only the small proportion of hospitalists who voluntarily identified in PECOS using a recently established Medicare specialty billing code (C6). However, given the demonstrated growth in the number of hospitalists, the 2006 valuations reflected a provider mix that is no longer representative of the healthcare system today. Therefore we believe this meets the CE criteria for shift to another specialty with different knowledge base.

Survey Analysis

The specialty societies discussed that the work RVUs for the initial inpatient/observation codes, the discharge codes, and the same day admission/discharge codes must be in proper rank order to each other (and to the office visit codes). Similarly, the subsequent inpatient/observation visit codes must be in proper rank order to the initial visit codes and comparable office visit codes.

As a threshold matter, the expert panel reviewed the intensity/complexity measures for all the codes. For virtually all the codes, well over 50% of respondents reported that the intensity and complexity of these services was somewhat, or much more than the reference services which were mostly office visits. This confirmed the panel's understanding that inpatient visits are more intense the outpatient office visits.

[9] Society of Hospital Medicine. 2020 State of Hospital Medicine Report. Published August 2020.

[10] Unpublished analysis by the Society of Hospital Medicine on publicly available Medicare Provider Utilization and Payment Data.

There were 59 respondents of whom 86% found the vignette to be typical. The survey times and median RVW were 0/85/12/97/4.30 and the 25th percentile RVW was 3.55.

The previous survey data was: 75 respondents of whom 91% found the vignette to be typical. The survey times and median work RVU were 0/60/0/60/3.60 and the 25th percentile work RVU was 2.85.

The current times and work RVU are 19/55/20/94/4.20.

The key reference services were 99205, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter, with times and work RVU of 14/59/15/88/3.50, and 99291 Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes, with times and RVW of 15/40/15/70/4.50.

The key reference services for the previous survey were 99205 and 99215.

For reference: 99215, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter, with times and work RVU of 10/45/15/70/2.80.

The expert panel noted that the time of 97 minutes is 3 minutes more than the current time and 9 minutes more than the total time for 99205, the main key reference service. It is also 10 minutes more than that of 99291 but the intensity is less.

The expert panel agreed that because of the higher intensity of hospital care and the 9 minute time differential with 99205, the 25th percentile work RVU of 3.55 was too low and would create a rank order anomaly. On the other hand, the survey median work RVW of 4.30 reflects the increased time and would place 99236 in proper rank order to both key reference services.

The expert panel noted that the time for 99236 is 27% higher than the time for 99235 and the survey median RVW of 4.3 is 32% more than the current RVW for 99235.

Therefore, the expert panel recommends the survey intra 85 minutes, post time 12 minutes /total time of 97 minutes and the survey median RVW of 4.30.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99236

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Internal Medicine How often? Commonly

Specialty Hospitalist How often? Commonly

Specialty Family Medicine How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 4811919
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We anticipate 3 times the annual Medicare utilization; based on 2019 utilization data.

Specialty Internal Medicine Frequency 177819 Percentage 3.69 %

Specialty Hospitalist Frequency 56257 Percentage 1.16 %

Specialty Family Medicine Frequency 42881 Percentage 0.89 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
131,135 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2019 Medicare utilization from the RUC database.

Specialty Internal Medicine Frequency 4839 Percentage 3.69 %

Specialty Hospitalist Frequency 1522 Percentage 1.16 %

Specialty Family Medicine Frequency 1168 Percentage 0.89 %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Hospital inpatient or observation discharge day management; 30 minutes or less.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient receives hospital inpatient or observation discharge day management services requiring 30 minutes or less of total time.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Review medical records and other available data. Obtain an interval history and perform a physical examination. Formulate and/or revise diagnosis and treatment plan(s), including making the decision for discharge. Review information regarding availability, safety, and adequacy of post-discharge support systems. Discuss aftercare treatment with patient, family and/or caregivers and other health care professionals. Provide care coordination for transition that includes instructions to patient/caregivers for aftercare. Write orders for post-discharge follow-up professional services and testing as necessary. Reconcile patient's medications with attention to pre-admission therapy, inpatient/observation therapy, and outpatient formulary. Write prescriptions as necessary. Complete discharge and aftercare forms. Inform referring physician of discharge plans. Complete medical record documentation.

Description of Post-Service Work: Review and sign off all discharge records. Respond to patient/caregiver and other healthcare provider post-discharge questions related to facility stay until the primary care physician assumes care. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management related to this facility stay. Receive and respond to any interval testing results or correspondence, including obtaining results pending at discharge, until the primary care physician assumes care.

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99213	XXX	1.30	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99214	XXX	1.92	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99202	XXX	0.93	**RUC Time**	2,490,658

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99203	XXX	1.60	**RUC Time**	11,452,897

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	25%	73%	2%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	5%	41%	54%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	68%	27%
Physical effort required	9%	48%	43%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	32%	61%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	31%	61%	8%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	41%	56%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	82%	18%
Physical effort required	0%	62%	38%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	31%	64%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In February 2021, the CPT Editorial Panel deleted seven observation care codes and revised eleven codes to merge inpatient and observation care and to align with the principles included in the office or other outpatient E/M services (99202-99215) by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visit codes, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of an inpatient hospital or observation care visit code, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing and managing the patient are summed to select the appropriate code. The inpatient and observation care services were surveyed for the October 2021 RUC meeting. The survey time captured the total time on the date of encounter by calendar date. All the codes were surveyed in June/July and discussed at length for the October 2021 RUC meeting as well as several pre facilitation meetings.

In October 2021, the RUC referred these services to be resurveyed because the survey did not include a request for distinct time before and after floor/unit time, therefore could not be compared to previous RUC surveys of these services.

The Inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) were surveyed again by the specialty societies with the research approved revised survey tool. The survey societies sent out the survey randomly to members in November 2021 for presentation at the January 2022 RUC meeting.

The surveying societies were:
American Academy of Hospice and Palliative Medicine
American Academy of Neurology
American Association of Neurological Surgeons/Congress of Neurological Surgeons
American Academy of Orthopaedic Surgeons
American Academy of Pediatrics
American Association for Thoracic Surgery
American College of Cardiology
American College of Chest Physicians
American College of Obstetricians and Gynecologists
American College of Physicians
American College of Surgeons
American Geriatrics Society
American Nurses Association
American Society of Clinical Oncology
American Society of Colon and Rectal Surgeons
American Society for Surgery of the Hand
American Thoracic Society
Infectious Diseases Society of America
North American Spine Society
Society of Hospital Medicine
Society of Thoracic Surgeons
Society for Vascular Surgery

Details of the Research Approved Revised Survey Tool for inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) at the January 2021 RUC meeting

As discussed at the October 2021 RUC meeting, the specialty societies believed that the intraservice time data was flawed. The societies believed that some respondents may have only been considering floor/unit time and not the time before or after floor/unit time on the date of encounter. The RUC agreed with the specialty societies to resurvey the inpatient and observation E/M services, after revision of the survey tool to include definitions of time before and after floor/unit time. This would allow better comparison to prior surveys that included these time components. It should be noted that although the revised survey tool included a worksheet question asking for separate on/off floor times on the date of service, this question was followed by a question that included the summed total time for respondent confirmation that the total time was accurate. If the respondent did not agree with the total time for one or more of the codes as arrayed, then the respondent was asked to return to the worksheet question and adjust the times as needed. The respondent could not move forward in the survey before affirming that the total times on the date of encounter were accurate. This total time confirmation is important because the joint societies believe the correct analysis is to use the total time as confirmed by the survey respondent. Both survey tools are included in the RUC materials. We note that the total time presented in our SoRs and in our RUC summary materials are the statistics of the total time as calculated in the survey tool and verified by the survey respondent. For full transparency, additional details on the survey tool questions and responses is provided in a separate informational file.

Compelling Evidence

We believe we meet several compelling evidence criteria

1.) Documentation by "Other reliable data" for change in physician work
   a. *Change in patient population*
   b. *Change in length of hospital stay*
   c. *Change in Technology*
   d. *Change in Knowledge (new provider type)*

Documentation by Other reliable data

Our compelling evidence is based on four types of changes: a.) patient population; b.) reduced length of stay; c.) change in technology (inpatient EHRs); and d.) change in knowledge (new provider type). We believe each of these meet the criteria for "***other reliable data.***"

Change in patient population

The number of diagnoses that appear in the Medicare claims for Inpatient Visits (based on the 5% file) has increased over the years since these codes were last reviewed. The largest changes are occurring at the higher-level services. Since 2006 the number of diagnoses has increased by more than 30% for all the codes except 99221 and 99222 which have gone up 25%. For example, for 99223 the number has increased by 31% and for 99233, the increase is 41%.

Our experts are experiencing more complicated patients, with more clinical indications to review and consider, while balancing moving these more complicated patients to the next setting of care, such as a SNF. The chart below supports the fact that patients at higher level codes have more indications to consider in decision making and physicians/QHP caring for these patients are being asked to move those patients along to the next level of care and shorter LOS.

CPT Code	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	Percentage Change

The demographics of hospitalized patients continue to change over time, particularly as payors and patients apply pressure to provide care in the lowest, safest acuity setting. Medicare and Medicaid patients continue to grow as a proportion of inpatient stays. In 1999, Medicare patients made up 35.9% of inpatients and Medicaid patients, 16.6%. By 2018, these proportions increased significantly: Medicare (40.9%) and Medicaid (22.7%).[1] This shift was almost entirely accounted for by decrease in inpatients with private insurance, while overall number of hospitalizations nationwide remained relatively constant. Over the

[1] Agency for Healthcare Research and Quality (AHRQ). HCUP Fast Stats—Trends in Inpatient Stays. Accessed November 29, 2021, via https://www.hcup-us.ahrq.gov/faststats/NationalTrendsServlet/

same 1999-2018 period, average length of stay for Medicare patients declined from 6.0 days to 5.2 days and Medicaid patients stayed similar (4.5 days to 4.6 days).[2]

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

Change in length of hospital stay

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

In addition, a published report from the OIG has documented significant decreases in length of stay and that hospitals are billing the highest severity DRGs more frequently.

The OIG stated:
"Hospitals are increasingly billing for inpatient stays at the highest severity level, which is the most expensive one. The number of stays at the highest severity level increased almost 20 percent from FY 2014 through FY 2019, ultimately accounting for nearly half of all Medicare spending on inpatient hospital stays. The number of stays billed at each of the other severity levels decreased. At the same time, the average length of stay decreased for stays at the highest severity level, while the average length of all stays remained largely the same."

While this OIG article suggests that providers may be upcoding, the expert panels' experience suggest that the trend supports the fact that physicians/QHPs are caring for patients who have many more contributing conditions and increased pressure to get the patient on to the next level of care outside the acute care setting of the inpatient stay. This requires more intense and complex work in a shorter period of time.

Change in Technology

Outpatient EHRs are significantly different from inpatient EHRs. Some of the most obvious differences are requirements for pharmacy potential interactions to be overridden by the physician, as necessary. Additionally, flags are frequently popping up as they are put in place for safety reasons, however, these flags require physician/QHP rather than clinical staff to review and override after decisions for treatments have been modified and thus requires the physician/QHP to go back to the EHR before the clinical staff can continue with care of the patient such as a medication change.

The American Hospital Association reported that in 2017[3] 95% of hospitals had some form of EHR implemented. This is significant change from 2006. As reported in 2006 by the Healthcare Financial Management Association, only 13% of hospitals had an EHR for health outcomes; 13% for clinical decision support; and 2% for patient access.

[3] SOURCE: ONC/American Hospital Association (AHA), AHA Annual Survey Information Technology Supplement: 2015-2017.

Data from the Chronic Conditions Data Warehouse also support our assertion that Medicare patients have increasing rates of comorbidities that in turn increase the complexity of hospitalizations. In addition to high prevalence of diabetes, hypertension and COPD among Medicare beneficiaries, there has been marked increase between 2010 and 2019 in rates of chronic kidney disease (15% to 26%), depression (14% to 19%) and rheumatoid arthritis/osteoarthritis (29% to 35%).

Change in Knowledge (new HOSPITALIST specialty provider type)

Hospitalists are a new specialty that was not fully organized as a specialty in 2006 when the codes were last surveyed and is a specialty that continues to grow. The term "hospitalist" was coined in 1996 to describe a trend of primary care physicians choosing to practice exclusively in the hospital[4] and the field began to organize in earnest in the early 2000s. Hospitalists are predominantly internal medicine trained, but there are also a significant number of hospitalists with the specialties of family medicine, pediatrics, and medical subspecialties. In 2011, there were 25,787 adult hospitalists identified using a 90% threshold of Medicare billing claims associated with hospitalizations.[5] In 2012, there were 28,473 hospitalists identified using a nearly identical 90% threshold.[6] New analyses using the same data and methodology suggest the field has continued to grow at a similar rate through 2019, with approximately 44,000 hospitalists identified.[7] This shows that the field continues to grow and the model and systems of care associated with hospitalists continues to spread. In 2006, the impact of hospitalists on the care of hospitalized patients would not have been as pronounced as it is today.

Hospitalist practice diverges from the model of outpatient primary care rounding in the hospital on their patients in several important ways. First, hospitalists provide 24-hour coverage of patients in the hospital using a shift-based model. Shifts are typically 12 (~64% of groups) or 10 (~20% of groups) hours long.[8] Shift-based coverage makes at least one handoff between physicians during a 24-hour period ubiquitous. About 50% of hospitalist groups use a daytime admitter model or a hybrid for admissions,[9] meaning patients who enter the hospital overnight are admitted by one clinician and then dedicated staff the following morning continue the care. These handoffs make assessments of time spent with the patient on a calendar day difficult, but reflect the reality of team-based care in many hospitals.

Finally, using 90% threshold-identified hospitalists to examine trends in Medicare billing data shows that, in 2019, hospitalists are billing the plurality of charges for nearly all of the hospital visit E/M codes. For example, in 2019, hospitalists accounted for 10.2% of 99221, 15.1% of 99222 and 31.9% of 99223 of the total volume of Medicare bills for each of these codes.[10]

We concede that the existing data in the RUC database attributes a much smaller proportion of billing claims to hospitalists as this includes only the small proportion of hospitalists who voluntarily identified in PECOS using a recently established Medicare specialty billing code (C6). However, given the demonstrated growth in the number of hospitalists, the 2006 valuations reflected a provider mix that is no longer representative of the healthcare system today. Therefore we believe this meets the CE criteria for shift to another specialty with different knowledge base.

Survey Analysis

The specialty societies discussed that the work RVUs for the initial inpatient/observation codes, the discharge codes, and the same day admission/discharge codes must be in proper rank order to each other (and to the office visit codes). Similarly, the subsequent inpatient/observation visit codes must be in proper rank order to the initial visit codes and comparable office visit codes.

Note: The sample consists of 3,599 non-federal acute care hospitals. "There was a 7 percent increase between 2015 and 2016 in the percent of hospitals that use their EHR data." ONC Data Brief ■ No. 46■ April 2019

As a threshold matter, the expert panel reviewed the intensity/complexity measures for all the codes. For virtually all the codes, well over 50% of respondents reported that the intensity and complexity of these services was somewhat, or much more than the reference services which were mostly office visits. This confirmed the panel's understanding that inpatient visits are more intense the outpatient office visits.

99238 Review and Recommendations

There were 167 respondents of whom 89% found the vignette to be typical. The survey times and median RVW were 0/28/10/38/1.90 and the 25th percentile RVW was 1.50.

The previous survey data was: 215 respondents of whom 89% found the vignette to be typical. The median times and work RVU were 0/26/0/26/1.75 and the 25th percentile work RVU was 1.40.

The current times and work RVU are 8/20/10/38/1.28.

The key reference services were 99213, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter, with times and work RVU of 5/20/5/30/1.30, and 99214, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter, with times and work RVU of 7/30/10/47/1.92.

These are the same key reference services as for the previous survey.

Because this is a time-based code, the expert panel focused on comparing the survey times to the existing times and reference service times. The expert panel noted that the time of 38 minutes is identical to the current total time. It is also 8 minutes high than 99213 which has an RVW of 1.30 and 9 minutes less than 99214 which has an RVW of 1.92.

Based on this information, the expert panel agreed that the 25th percentile RVW of 1.5 placed 99238 in proper rank order to both key reference services.

Therefore, the expert panel recommends the survey intra 28, post time 10/total time of 38 minutes and the 25th percentile RVW of 1.50.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99238, 99217

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Internal Medicine How often? Commonly

Specialty Family Medicine How often? Commonly

Specialty Hospitalist How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 7651503
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We anticipate 3 times the annual Medicare utilization; based on 2019 utilization data.

Specialty Internal Medicine Frequency 3305449 Percentage 43.19 %

Specialty Family Medicine Frequency 1086513 Percentage 14.19 %

Specialty Hospitalist Frequency 788105 Percentage 10.30 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,036,538 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2019 Medicare utilization from the RUC database.

Specialty Internal Medicine Frequency 1311481 Percentage 43.19 %

Specialty Family Medicine Frequency 430885 Percentage 14.19 %

Specialty Hosptialist Frequency 312764 Percentage 10.30 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Hospital visit

BETOS Sub-classification Level II:

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99238

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Descriptor: Hospital inpatient or observation discharge day management; more than 30 minutes.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient receives hospital inpatient or observation discharge day management services requiring greater than 30 minutes of total time

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Review medical records and other available data. Obtain an interval history and perform a physical examination. Formulate and/or revise diagnosis and treatment plan(s), including making the decision for discharge. Review information regarding availability, safety, and adequacy of post-discharge support systems. Discuss aftercare treatment with patient, family and/or caregivers and other health care professionals. Provide care coordination for transition that includes instructions to patient/caregivers for aftercare. Write orders for post-discharge follow-up professional services and testing as necessary. Reconcile patient's medications with attention to pre-admission therapy, inpatient/observation therapy, and outpatient formulary. Write prescriptions as necessary. Complete discharge and aftercare forms. Inform referring physician of discharge plans. Complete medical record documentation.

Description of Post-Service Work: Review and sign off all discharge records. Respond to patient/caregiver and other healthcare provider post-discharge questions related to facility stay until the primary care physician assumes care. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management related to this facility stay. Receive and respond to any interval testing results or correspondence, including obtaining results pending at discharge, until the primary care physician assumes care.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	2%	22%	51%	25%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	2%	31%	67%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	62%	34%
Physical effort required	4%	51%	45%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	24%	69%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	8%	10%	70%	12%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	10%	25%	65%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	13%	55%	32%
Physical effort required	15%	30%	55%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	10%	18%	72%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In February 2021, the CPT Editorial Panel deleted seven observation care codes and revised eleven codes to merge inpatient and observation care and to align with the principles included in the office or other outpatient E/M services (99202-99215) by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visit codes, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of an inpatient hospital or observation care visit code, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing and managing the patient are summed to select the appropriate code. The inpatient and observation care services were surveyed for the October 2021 RUC meeting. The survey time captured the total time on the date of encounter by calendar date. All the codes were surveyed in June/July and discussed at length for the October 2021 RUC meeting as well as several pre facilitation meetings.

In October 2021, the RUC referred these services to be resurveyed because the survey did not include a request for distinct time before and after floor/unit time, therefore could not be compared to previous RUC surveys of these services.

The Inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) were surveyed again by the specialty societies with the research approved revised survey tool. The survey societies sent out the survey randomly to members in November 2021 for presentation at the January 2022 RUC meeting.

The surveying societies were:
American Academy of Hospice and Palliative Medicine
American Academy of Neurology
American Association of Neurological Surgeons/Congress of Neurological Surgeons
American Academy of Orthopaedic Surgeons
American Academy of Pediatrics
American Association for Thoracic Surgery
American College of Cardiology
American College of Chest Physicians
American College of Obstetricians and Gynecologists
American College of Physicians
American College of Surgeons
American Geriatrics Society
American Nurses Association
American Society of Clinical Oncology
American Society of Colon and Rectal Surgeons
American Society for Surgery of the Hand
American Thoracic Society
Infectious Diseases Society of America
North American Spine Society
Society of Hospital Medicine
Society of Thoracic Surgeons
Society for Vascular Surgery

Details of the Research Approved Revised Survey Tool for inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) at the January 2021 RUC meeting

As discussed at the October 2021 RUC meeting, the specialty societies believed that the intraservice time data was flawed. The societies believed that some respondents may have only been considering floor/unit time and not the time before or after floor/unit time on the date of encounter. The RUC agreed with the specialty societies to resurvey the inpatient and observation E/M services, after revision of the survey tool to include definitions of time before and after floor/unit time. This would allow better comparison to prior surveys that included these time components. It should be noted that although the revised survey tool included a worksheet question asking for separate on/off floor times on the date of service, this question was followed by a question that included the summed total time for respondent confirmation that the total time was accurate. If the respondent did not agree with the total time for one or more of the codes as arrayed, then the respondent was asked to return to the worksheet question and adjust the times as needed. The respondent could not move forward in the survey before affirming that the total times on the date of encounter were accurate. This total time confirmation is important because the joint societies believe the correct analysis is to use the total time as confirmed by the survey respondent. Both survey tools are included in the RUC materials. We note that the total time presented in our SoRs and in our RUC summary materials are the statistics of the total time as calculated in the survey tool and verified by the survey respondent. For full transparency, additional details on the survey tool questions and responses is provided in a separate informational file.

Compelling Evidence

We believe we meet several compelling evidence criteria

1.) Documentation by "Other reliable data" for change in physician work
   a. *Change in patient population*
   b. *Change in length of hospital stay*
   c. *Change in Technology*
   d. *Change in Knowledge (new provider type)*

Documentation by Other reliable data

Our compelling evidence is based on four types of changes: a.) patient population; b.) reduced length of stay; c.) change in technology (inpatient EHRs); and d.) change in knowledge (new provider type). We believe each of these meet the criteria for "***other reliable data.***"

Change in patient population

The number of diagnoses that appear in the Medicare claims for Inpatient Visits (based on the 5% file) has increased over the years since these codes were last reviewed. The largest changes are occurring at the higher-level services. Since 2006 the number of diagnoses has increased by more than 30% for all the codes except 99221 and 99222 which have gone up 25%. For example, for 99223 the number has increased by 31% and for 99233, the increase is 41%.

Our experts are experiencing more complicated patients, with more clinical indications to review and consider, while balancing moving these more complicated patients to the next setting of care, such as a SNF. The chart below supports the fact that patients at higher level codes have more indications to consider in decision making and physicians/QHP caring for these patients are being asked to move those patients along to the next level of care and shorter LOS.

CPT Code	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	Percentage Change
99221	2.46	2.61	2.76	2.83	2.31	2.39	2.48	2.55	2.64	2.76	2.92	3.06	3.18	3.26	**24%**

The demographics of hospitalized patients continue to change over time, particularly as payors and patients apply pressure to provide care in the lowest, safest acuity setting. Medicare and Medicaid patients continue to grow as a proportion of inpatient stays. In 1999, Medicare patients made up 35.9% of inpatients and Medicaid patients, 16.6%. By 2018, these proportions increased significantly: Medicare (40.9%) and Medicaid (22.7%).[1] This shift was almost entirely accounted for by decrease in inpatients with private insurance, while overall number of hospitalizations nationwide remained relatively constant. Over the

[1] Agency for Healthcare Research and Quality (AHRQ). HCUP Fast Stats—Trends in Inpatient Stays. Accessed November 29, 2021, via https://www.hcup-us.ahrq.gov/faststats/NationalTrendsServlet/

same 1999-2018 period, average length of stay for Medicare patients declined from 6.0 days to 5.2 days and Medicaid patients stayed similar (4.5 days to 4.6 days).[2]

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

Change in length of hospital stay

Case-Mix Index (CMI) data (from the CMS Limited Data Set) using 100% of the Medicare Fee for Service population also bear out the assertions that the severity of illness and risk of adverse outcome of hospitalized patients continues to increase over time, while average length of stay for acute care hospitalizations trends downwards, excepting the impact of the COVID-19 pandemic in 2020 and 2021.

In addition, a published report from the OIG has documented significant decreases in length of stay and that hospitals are billing the highest severity DRGs more frequently.

The OIG stated:
"Hospitals are increasingly billing for inpatient stays at the highest severity level, which is the most expensive one. The number of stays at the highest severity level increased almost 20 percent from FY 2014 through FY 2019, ultimately accounting for nearly half of all Medicare spending on inpatient hospital stays. The number of stays billed at each of the other severity levels decreased. At the same time, the average length of stay decreased for stays at the highest severity level, while the average length of all stays remained largely the same."

While this OIG article suggests that providers may be upcoding, the expert panels' experience suggest that the trend supports the fact that physicians/QHPs are caring for patients who have many more contributing conditions and increased pressure to get the patient on to the next level of care outside the acute care setting of the inpatient stay. This requires more intense and complex work in a shorter period of time.

Change in Technology

Outpatient EHRs are significantly different from inpatient EHRs. Some of the most obvious differences are requirements for pharmacy potential interactions to be overridden by the physician, as necessary. Additionally, flags are frequently popping up as they are put in place for safety reasons, however, these flags require physician/QHP rather than clinical staff to review and override after decisions for treatments have been modified and thus requires the physician/QHP to go back to the EHR before the clinical staff can continue with care of the patient such as a medication change.

The American Hospital Association reported that in 2017[3] 95% of hospitals had some form of EHR implemented. This is significant change from 2006. As reported in 2006 by the Healthcare Financial Management Association, only 13% of hospitals had an EHR for health outcomes; 13% for clinical decision support; and 2% for patient access.

[3] SOURCE: ONC/American Hospital Association (AHA), AHA Annual Survey Information Technology Supplement: 2015-2017.

Data from the Chronic Conditions Data Warehouse also support our assertion that Medicare patients have increasing rates of comorbidities that in turn increase the complexity of hospitalizations. In addition to high prevalence of diabetes, hypertension and COPD among Medicare beneficiaries, there has been marked increase between 2010 and 2019 in rates of chronic kidney disease (15% to 26%), depression (14% to 19%) and rheumatoid arthritis/osteoarthritis (29% to 35%).

Change in Knowledge (new HOSPITALIST specialty provider type)

Hospitalists are a new specialty that was not fully organized as a specialty in 2006 when the codes were last surveyed and is a specialty that continues to grow. The term "hospitalist" was coined in 1996 to describe a trend of primary care physicians choosing to practice exclusively in the hospital[4] and the field began to organize in earnest in the early 2000s. Hospitalists are predominantly internal medicine trained, but there are also a significant number of hospitalists with the specialties of family medicine, pediatrics, and medical subspecialties. In 2011, there were 25,787 adult hospitalists identified using a 90% threshold of Medicare billing claims associated with hospitalizations.[5] In 2012, there were 28,473 hospitalists identified using a nearly identical 90% threshold.[6] New analyses using the same data and methodology suggest the field has continued to grow at a similar rate through 2019, with approximately 44,000 hospitalists identified.[7] This shows that the field continues to grow and the model and systems of care associated with hospitalists continues to spread. In 2006, the impact of hospitalists on the care of hospitalized patients would not have been as pronounced as it is today.

Hospitalist practice diverges from the model of outpatient primary care rounding in the hospital on their patients in several important ways. First, hospitalists provide 24-hour coverage of patients in the hospital using a shift-based model. Shifts are typically 12 (~64% of groups) or 10 (~20% of groups) hours long.[8] Shift-based coverage makes at least one handoff between physicians during a 24-hour period ubiquitous. About 50% of hospitalist groups use a daytime admitter model or a hybrid for admissions,[9] meaning patients who enter the hospital overnight are admitted by one clinician and then dedicated staff the following morning continue the care. These handoffs make assessments of time spent with the patient on a calendar day difficult, but reflect the reality of team-based care in many hospitals.

Finally, using 90% threshold-identified hospitalists to examine trends in Medicare billing data shows that, in 2019, hospitalists are billing the plurality of charges for nearly all of the hospital visit E/M codes. For example, in 2019, hospitalists accounted for 10.2% of 99221, 15.1% of 99222 and 31.9% of 99223 of the total volume of Medicare bills for each of these codes.[10]

We concede that the existing data in the RUC database attributes a much smaller proportion of billing claims to hospitalists as this includes only the small proportion of hospitalists who voluntarily identified in PECOS using a recently established Medicare specialty billing code (C6). However, given the demonstrated growth in the number of hospitalists, the 2006 valuations reflected a provider mix that is no longer representative of the healthcare system today. Therefore we believe this meets the CE criteria for shift to another specialty with different knowledge base.

Survey Analysis

The specialty societies discussed that the work RVUs for the initial inpatient/observation codes, the discharge codes, and the same day admission/discharge codes must be in proper rank order to each other (and to the office visit codes). Similarly, the subsequent inpatient/observation visit codes must be in proper rank order to the initial visit codes and comparable office visit codes.

Note: The sample consists of 3,599 non-federal acute care hospitals. "There was a 7 percent increase between 2015 and 2016 in the percent of hospitals that use their EHR data." ONC Data Brief ■ No. 46■ April 2019

[10] Unpublished analysis by the Society of Hospital Medicine on publicly available Medicare Provider Utilization and Payment Data.

As a threshold matter, the expert panel reviewed the intensity/complexity measures for all the codes. For virtually all the codes, well over 50% of respondents reported that the intensity and complexity of these services was somewhat, or much more than the reference services which were mostly office visits. This confirmed the panel's understanding that inpatient visits are more intense the outpatient office visits.

99239 Review and Recommendations

There were 171 respondents of whom 95% found the vignette to be typical. The survey times and median RVW were 0/45/19/64/2.90 and the 25th percentile RVW was 2.15.

The previous survey data was: 204 respondents of whom 93% found the vignette to be typical. The survey times and median work RVU were 0/45/0/45/2.75 and the 25th percentile work RVU was 2.00.

The current times and work RVU are 10/30/15/55/1.90.

The key reference services were 99215, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter, with times and work RVU of 10/45/15/70/2.80, and 99214, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter, with times and work RVU of 7/30/10/47/1.92.

These are the same key reference services as the previous survey.

Because this is a time-based code, the expert panel focused on comparing the survey times to the existing times and reference service times. The survey time for 99239 is 6 minutes less than the total time for 99215 (RVW of 2.80), 17 minutes higher than the total time for 99214 (RVW of 1.92), and 9 minutes higher than the current time.

Therefore, the expert panel agreed that the 25th percentile RVW of 2.15 placed 99239 in proper rank order with both key reference services and reflects the increased time as compared to the current time.

The expert panel then compared the survey data to the recommendations for 99238. The survey time for 99239 is 68% higher than the time for 99238 and the 25th percentile RVW is 43% higher than the recommended RVW for 99238 (1.50).

Therefore, the expert panel recommends the survey intra 45, post time 19/total time of 64 minutes and the survey 25th percentile work RVU of 2.15.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99239, 99217

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Internal Medicine How often? Commonly

Specialty Hospitalist How often? Commonly

Specialty Family Medicine How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 15569490
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We anticipate 3 times the annual Medicare utilization; based on 2019 utilization data.

Specialty Internal Medicine Frequency 8049426 Percentage 51.69 %

Specialty Hospitalist Frequency 3300732 Percentage 21.20 %

Specialty Family Medicine Frequency 1463532 Percentage 9.39 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 6,176,631 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2019 Medicare utilization from the RUC database.

Specialty Internal Medicine Frequency 3192701 Percentage 51.69 %

Specialty Hospitalist Frequency 1309446 Percentage 21.20 %

Specialty Family Medicine Frequency 579996 Percentage 9.39 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Hospital visit

BETOS Sub-classification Level II:

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99239

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Vignette(s) (*vignette required even if PE only code(s)***):**

99221	A patient with an acute, uncomplicated illness or injury is admitted for either initial inpatient or observation care services.
99222	A patient with an acute illness with systemic symptoms or acute~~,~~ complicated injury is admitted for either initial inpatient or observation care services.
99223	A patient with a chronic illness with severe exacerbation, or an acute illness/injury that poses a threat to life or bodily function is admitted for either initial inpatient or observation care services.
99231	A patient with an acute illness or injury whose condition is improving or is stable receives subsequent hospital inpatient or observation care.
99232	A patient with an illness or acute injury that is progressing or requires ongoing diagnostic evaluation, medical management or potential surgical treatment receives subsequent hospital inpatient or observation care.
99233	A patient who is unstable or has developed a significant complication or a significant new problem receives subsequent hospital inpatient or observation care encounter.
99238	A patient receives hospital inpatient or observation discharge day management services requiring 30 minutes or less of total time.
99239	A patient receives Hospital inpatient or observation discharge day management services requiring greater than 30 minutes of total time.
99234	A patient with an acute, uncomplicated illness or injury is admitted for either initial inpatient or observation care services. The patient is discharged later that same day. (This service includes two or more encounters on the same date of which one of these encounters is an initial admission encounter and another encounter being a discharge encounter.)
99235	A patient with an acute illness with systemic symptoms or a patient with an acute complicated injury that requires medical management or potential surgical treatment is admitted for either initial inpatient or observation care services. The patient is discharged later that same day.(This service includes two or more encounters on the same date of which one of these encounters is an initial admission encounter and another encounter being a discharge encounter.)
99236	A patient with a severe exacerbation of a chronic illness or an acute illness/injury that poses a threat to life or bodily function is admitted for either initial inpatient or observation care services. The patient is discharged later that same day. (This service includes two or more encounters on the same date of which one of these encounters is an initial admission encounter and another encounter being a discharge encounter.)

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

The specialty Advisors reviewed the PE input history of the current codes.

In 2001, the RUC agreed that there are clinical staff activities associated with discharge day services. Typically, the office based physician staff will make a call to the patient's family and also one to the pharmacy. The RUC estimated that there are two 3-minute phone calls associated with code 99238 for a total of six minutes, and three 3-minute phone calls for a total of nine minutes total for 99239.

In 2002, the RUC discussed various methodologies for recognizing office based clinical staff time for hospital visits (99231-99233) that is spent in support of patients in the hospital and attempted to better define the activities involved in coordination of care. The activities considered as coordination of care are those phone calls that office based clinical staff have with 1) family

members who have clinical questions regarding care about a hospitalized patient, and 2) hospital clinical staff to exchange clinical data between the office and the hospital. These could be calls initiated by the hospital staff or by the office staff. The RUC reached a consensus that the office based staff do spend time on phone calls with a patient's family and with the hospital staff and these activities are in support of hospitalized patients and are necessary to provide good patient care.

The RUC discussed various ways to capture the time spent by clinical office staff on these activities. One proposal was to assign clinical staff time to the three hospital visit E/M codes (99231, 99232, 99233). Currently there are no direct inputs assigned to these codes. Under this proposal, the time would be assigned directly to the three codes and then applied to each global surgical code according to the number of times these codes appear in the global surgical package.

The RUC did not agree that assigning time to these E/M codes would be appropriate because the RUC was not convinced that such a building block methodology would lead to accurate time allocation. A building block approach worked for assigning time to the post operative office visits since there is typically contact with clinical office staff during these visits. However, the RUC did not feel that a similar methodology was appropriate for the hospital visit codes since it was not convinced that each hospital visit also includes clinical staff coordination of care activities. The RUC concluded that it was not possible to standardize the coordination of care time by allocating the time to the hospital visit codes.

However, the RUC felt it was important to validate the hospital E/M codes as this time while the global surgical codes are being reviewed, rather than at a later date. The RUC agreed that zero time should be assigned to the hospital visit codes due to the inability to develop a methodology to assign time to these codes.

The RUC then discussed an alternative methodology to assign time that would allocate additional time to the discharge day management codes. The rational is that for every code that has a full 99238 or 99239, additional time spent by office based clinical staff was necessary during the associated hospitalization. The RUC felt that developing a single standard of 6 minutes would simplify the refinement process as well as account for a typical time spent on coordination of care activities during the hospitalization. The time would be added to the time of the discharge day management codes (99238, 99239) and would therefore cover the staff activities performed in support of discharge day management and activities during the hospitalization.

The RUC approved the following two recommendations in 2002:

1. The RUC recommends that the hospital E/M codes 99231, 99232, and 99233 need to be validated at this time and the RUC proposes assigning zero direct inputs to these codes. These codes currently have zero inputs. The RUC agreed that assigning coordination of care time to each hospital visit would overstate the amount of time spent of these activities. The RUC could not agree that coordination of care activities occurred with each hospital visit or each day of hospitalization. Additionally, the work of coordination of care is currently included in the physician post-service work for these codes and assigning additional time specifically to these codes would lead to duplicate accounting of work.

2. The RUC recommends assigning an additional six minutes to the current times (from 2001) for

discharge day management codes 99238 and 99329, bringing the total time to 12 and 15 minutes, respectively. The RUC felt that there are coordination of care activities associated with hospitalization and therefore a suitable methodology for capturing this time would be to assign 6 minutes whenever a full discharge day management code is contained in either the RUC or CMS databases. The RUC agreed that the additional 6 minutes sufficiently captured the time of clinical office staff to perform coordination of care activities during a hospitalization.

CMS agreed with these recommendations.

In 2003, the PEAC E/M Workgroup examined each code family separately. For many of the codes the clinical staff times presented were crosswalked to previously approved times for selected E/M codes. For each crosswalk, the workgroup discussed the similarities and differences in clinical staff time between the reference code and the codes under refinement. **For the observation care codes 99234-99236,** the workgroup discussed in detail the appropriateness of cross walking the full 12 or 15 minutes currently assigned to 99238 and 99239. Although the observation care codes include admission and discharge on the same date the workgroup felt that the severity of these cases warrant using the full 12 and 15 minutes.

CMS initially agreed with this recommendation and published 12 minutes for 99234 and 15 minutes for 99235 and 99236 in the CY 2004 final rule PE detail file.

However, in the CY 2005 final rule PE detail file, the time for these three codes was reduced to zero minutes based on further refinement of earlier PEAC recommendations and unrefined codes [CMS–1429–FC, pp 66244]:

Adjustments To Conform With PEAC Standards
We also reviewed those codes that are currently unrefined or that were refined early in the PEAC process to apply some of the major PEAC-agreed standards.

The PEAC recommended that the discharge day management time apply only to 10-day and 90-day global services and we were complying with this recommendation. We also believe that this PEAC recommendation is reasonable; it is hard to imagine what tasks a physician's clinical staff back in the office is performing for a patient during the period that the patient is undergoing a same-day procedure in the hospital outpatient department. We also believe that it was appropriate to apply the PEAC standards to codes that were not refined or that were refined before the standards were developed. The application of these standards is not only fair, but can also help to avoid the possible rank order anomalies cited by the commenter.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (NOTE: *For services reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

Current codes are used as references.

3. Is this code(s) typically reported with an E/M service?

no

4. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment, and supplies, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

n/a

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require either minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

no

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

n/a

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

n/a

8. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

n/a

    b. Service period (includes pre, intra and post):

99238 and 99239
When discharge occurs on a date other than the date of admission, six minutes is allocated to 99238 and 99239 as a proxy for office clinical staff to perform coordination of care activities during a hospitalization including phone calls that office based clinical staff have with 1) family members who have clinical questions regarding care about a hospitalized patient, and 2) phone calls with hospital clinical staff to exchange clinical data between the office and the hospital. These could be calls initiated by the hospital staff or by the office staff. These activities are in support of hospitalized patients and are necessary to provide good patient care.

In addition to the six minutes for clinical staff work during a hospitalization, there are clinical staff activities associated with discharge day management services. Typically, there will be discharge management related calls to the patient/family/pharmacy/other providers. This work has not changed since the RUC approved two calls related to 99238 and three calls related to 99239.
In summary, 12 minutes (4 calls @ 3 min) is recommended for 99238 and 15 minutes (5 calls @ 3 min)

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see the *Billed Together* tab in the RUC Database)

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see the *Billed Together* tab in the RUC Database)

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment, and supplies, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

6. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

7. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

8. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

9. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs

NONFACILITY DIRECT PE INPUTS
CPT CODE(S): 99221-99223, 99231-99233, 99238-99239, 99234-99236
SPECIALTY SOCIETY(IES): AAFP, AAHPM, AAN, AANS/CNS, AAOS, AAP, AATS, ACC, ACOG, ACP, ACS, AGS, ANA, ASCO, ASCRS, ASSH, ATS, CHEST, IDSA, NASS, SHM, STS, SVS
PRESENTER(S): Thad Waites, MD, Edward Tuohy, MD

remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

10. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:
    b. Service period (includes pre, intra and post):
    c. Post-service period:

11. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

12. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

13. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet*):

14. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

15. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

16. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

17. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet*) please provide a paid invoice. Identify and explain the supply input and invoice here:

18. Are you recommending a PE supply pack for this recommendation? Yes or No.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

19. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

20. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet*) please provide a paid invoice. Identify and explain the equipment input and invoice here:

21. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (*please see fifth worksheet in PE spreadsheet*):

22. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

23. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time)*. If you have selected "other formula" for any of the equipment please explain here:

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated after the meeting and resubmitted asap.

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business. In addition, please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

*Codes highlighted in blue were reviewed by the RUC for CPT 2023. The surgical procedure times and values included for these codes are the RUC recommendations for CPT 2023. Also, any code that is being deleted for CPT 2023 was removed from this analysis.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2022

Inpatient Consultations – Tab 14

Following the implementation of the revisions to the Evaluation and Management (E/M) office visits (99201-99215) for the CPT 2021 code set, the CPT/RUC Workgroup on E/M met twelve times in 2020 and early 2021 to standardize the rest of the E/M sections in the CPT code set. The CPT/RUC Workgroup on E/M was committed to changing the current coding and documentation requirements for E/M visits to simplify the work of the health care provider and improve the health of the patient. To achieve these goals, the Workgroup set forth the following guiding principles related to the group's ongoing work product:

1. To decrease administrative burden of documentation and coding and align CPT and CMS whenever possible
2. To decrease the need for audits
3. To decrease unnecessary documentation in the medical record that is not needed for patient care
4. To ensure that payment for E/M is resource-based and that there is no direct goal for payment redistribution between specialties

In February 2021, the CPT Editorial Panel deleted two consultation codes and revised eight consultation codes to align with the principles included in the office or other outpatient E/M services (99202-99215) by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visits, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of an inpatient consultation, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing the patient are summed to select the appropriate code. The inpatient consultation services were initially surveyed for the October 2021 RUC meeting. The inpatient consultation survey time captured the total time on the date of encounter by calendar date. In October 2021, the RUC referred the inpatient and observation consultation services to be resurveyed, because the survey did not include a request for distinct fields for time before and after floor/unit time, and therefore could not be compared to previous RUC surveys of these services. The specialty societies revised their survey instrument by working with the Research Subcommittee. The RUC completed its review of the office or other outpatient consultation codes (99242-99245) at the October 2021 meeting and submitted recommendations for 99242-99245 to CMS only for those services.

Although the recommended work RVUs for codes 99252-99255 are not greater than the current values, the specialty societies noted, and the RUC agreed, that the compelling evidence of a change in the patient population and a change in technology that supported the increased work RVUs for the inpatient visit codes (99221-99239) also provides support for an increase in intensity of work for inpatient consultation codes. Specifically, that there has been a change in the patient population as Medicare patients have increasing rates of comorbidities that in turn increase the complexity and intensity of work. In addition to high prevalence of diabetes, hypertension, and COPD among Medicare beneficiaries, there has been marked increase between 2010 and 2019 in rates of chronic kidney disease (15% to 26%), depression (14% to 19%), and rheumatoid arthritis/osteoarthritis (29% to 35%). There has also been a change in technology. The establishment of EHRs since these codes were last reviewed has dramatically

changed care, allowing for more information requiring review and analysis. Patients present at a hospital with acute problems or exacerbation of current problems. Assessment of the problem needs to be performed expeditiously. The increased knowledge base in EHRs has increased intensity and complexity of patient care by requiring review and analysis of more data in the same or shorter amount of time. The American Hospital Association reported that in 2017, 95% of hospitals had some form of EHR implemented. This is a significant change from 2006. As reported in 2006 by the Healthcare Financial Management Association, only 13% of hospitals had an EHR for health outcomes; 13% for clinical decision support; and 2% for patient access.

Since the inception of the Medicare Physician Payment Schedule, the work RVUs for the inpatient consultation codes have always been valued higher than the inpatient visit E/M codes; the Harvard study acknowledged a relative difference in work in 1991 and the RUC confirmed a relative difference in work in 2006.

SURVEY PROCESS AND DATA ANALYSIS

The customized survey, vignettes, and reference service lists (RSL) were developed and approved by the Research Subcommittee in conjunction with the CPT/RUC Workgroup on E/M and input from the surveying specialties. The RSLs were specifically developed in an objective manner to represent relativity within the Medicare Physician Payment Schedule. The Research Subcommittee considered requests from the surveying specialties to add or remove codes from the initial lists originally developed by the Workgroup. The vignettes were developed by the CPT/RUC Workgroup on E/M and approved by the CPT Editorial Panel and the RUC's Research Subcommittee. Approximately 90% of respondents agreed that the vignettes described their typical patient.

The survey was the concerted effort of 25 specialty societies and other health care professional organizations. The RUC analyzed the responses and noted that the number of survey responses received per specialty correlated with those who perform inpatient consultation care visits in the Medicare Physician Payment Schedule, based on 2009 utilization data (when these services were last covered by Medicare). These data were summarized by categories of specialties (hospital, surgical, primary care, and medicine/other).

To ensure that survey respondents understood the new CPT guidelines and descriptors and the impact that these changes may have on their work, the RUC survey instrument required that each respondent carefully read the new descriptors/guidelines and attest that they had read the information before being allowed to proceed with the survey. The survey respondents understood that code selection could be based on either MDM or time on the date of the patient encounter. While the history and physical is no longer required for purposes of documentation, it is expected that a medically appropriate history and physical exam is performed during the visit.

For the inpatient or observation consultation codes (CPT codes 99252-99255) all time is on the date of encounter, thus intra-service time only for the purposes of . The survey instrument was revised to specify that "unit/floor time" is no longer the basis of time when selecting a code level based upon time. It is total time on the date of the encounter, whether on or off the "unit/floor". The survey asked about the different components of time to ensure that the respondents considered all appropriate time for these services before floor time, floor time and after floor time. The respondents then needed to confirm that the summed time of the components was the accurate total time on the date of encounter for each service to proceed with the survey. Additional details on the survey tool questions and responses are provided in the letter from the specialty societies.

99252 ***Inpatient or observation consultation for a new or established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using total time on the date of the encounter for code selection, 35 minutes must be met or exceeded.***
The RUC reviewed the survey results from 206 physicians and other qualified health care professionals (QHPs) and determined the survey median work RVU of 1.50 appropriately accounts for the physician and other QHP work required to perform this service. The RUC recommends 35 minutes total time. The RUC noted that CPT code 99251 has been deleted and some or all its previous utilization will now be reported with CPT code 99252. The 2009 Medicare utilization of CPT code 99251 was only 27% of the Medicare utilization for 99252, thus the typical patient for a 99252 will not change.

The specialties noted, and the RUC concurred, that inpatient and observation consultation codes should be valued somewhat higher than the analogous inpatient or observation new patient visit with the same level of medical decision making to account for the work of generating and sending a written report to the requesting physician. However, it was noted that the revised descriptor for CPT code 99221 (RUC recommended work RVU = 1.63, 40 minutes total time) is for straightforward or low medical decision making, whereas inpatient consultation code 99252 is only for a straightforward level of medical decision making, justifying a somewhat lower valuation for 99252 relative to 99221. The report prepared by the consultation physician would provide recommendations for the management of the patient and identify additional labs, imaging and/or tests to be performed.

To justify a work RVU of 1.50, the RUC compared the surveyed code to the top key reference service and MPC code 99202 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter* (work RVU = 0.93, 20 minutes total time) and determined that CPT code 99252 typically requires substantially more physician work and 15 more minutes of total time, thus would be valued appropriately higher with a work value of 1.50. The RUC compared the surveyed code to the 2nd key reference service and MPC code 99203 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter.* (work RVU = 1.60, 35 minutes total time) and noted that although both services involve an identical amount of total time, the surveyed code involves a lower level of medical decision making relative to the reference code (straightforward vs. low), and therefore maintains relativity with this reference service. **The RUC recommends a work RVU of 1.50 for CPT code 99252.**

99253 ***Inpatient or observation consultation for a new or established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded.***
The RUC reviewed the survey results from 219 physicians and other QHPs and determined the survey median work RVU of 2.00 appropriately accounts for the physician and other QHP work required to perform this service. The RUC recommends 45 minutes total time.

The specialties noted, and the RUC concurred, that inpatient and observation consultation codes should be valued somewhat higher than the analogous inpatient or observation new patient visit with the same level of medical decision making to account for the work of generating and sending a written report to the requesting physician. However, it was noted that the revised descriptor for CPT code 99221(RUC recommended

work RVU = 1.63, 40 minutes total time) is for straightforward or low medical decision making, whereas inpatient consultation code 99253 is only for a low level of medical decision making, justifying a higher valuation for 99253 relative to 99221. The report prepared by the consultation physician would provide recommendations for the management of the patient and identify additional labs, imaging and/or tests to be performed.

To justify a work RVU of 2.00, the RUC compared the surveyed code to the top key reference service and MPC code 99203 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter.* (work RVU = 1.60, 35 minutes total time) and determined that CPT code 99253 typically requires more physician work and time, thus would be valued appropriately higher with a work value of 2.00. The RUC also compared the surveyed code to MPC code 99214 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter.* (work RVU= 1.92, total time of 47 minutes) and noted that the reference code typically involves 2 more minutes of total time and is for a moderate level of medical decision making. However, the surveyed code is for both new and established patients, is in the inpatient setting, and is a consultation, which collectively is more work than the level of medical decision making and minor time differentials when compared with 99214. In addition, the RUC compared the surveyed code to MPC code 72158 *Magnetic resonance (eg, proton) imaging, spinal canal and contents, without contrast material, followed by contrast material(s) and further sequences; lumbar* (work RVU = 2.29, 35 minutes total time) as additional support of the recommended value. **The RUC recommends a work RVU of 2.00 for CPT code 99253.**

99254 ***Inpatient or observation consultation for a new or established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, 60 minutes must be met or exceeded.***
The RUC reviewed the survey results from 234 physicians and other QHPs and determined the survey 25th percentile work RVU of 2.72 appropriately accounts for the physician and other QHP work required to perform this service. The RUC recommends 60 minutes total time.

To justify a work RVU of 2.72, the RUC compared the surveyed code to top key reference code 99204 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter* (work RVU= 2.60, total time of 60 minutes) and concurred that, even though both services have identical total time, code 99254 should be valued with a slightly higher work RVU relative to 99204 to account for the increased intensity and complexity of the hospitalized patient. The RUC referenced that 78% of the survey respondents that selected this top key reference service had indicated that 99254 is more intense/complex. The RUC also compared the surveyed code to 99215 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter.* (work RVU= 2.80, total time of 70 minutes) and noted that the reference code typically involves 10 more minutes of total time and is for a high level of medical decision making. However, the surveyed code is for both new and established patients, is in the inpatient setting and is a consultation, which combined nearly offset the level of medical decision making and time differentials. **The RUC recommends a work RVU of 2.72 for CPT code 99254.**

99255 ***Inpatient or observation consultation for a new or established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of the encounter for code selection, 80 minutes must be met or exceeded.***

The RUC reviewed the survey results from 223 physicians and other QHPs and determined that the survey median work RVU somewhat overestimated and the survey 25th percentile underestimated the physician and QHP work typically required to perform this service. , The RUC agreed that a value between the survey 25th percentile and survey median would most appropriately account for the physician and other QHP work required to perform this service. The RUC recommends a direct work RVU crosswalk to CPT code 95720 *Electroencephalogram (EEG), continuous recording, physician or other qualified health care professional review of recorded events, analysis of spike and seizure detection, each increment of greater than 12 hours, up to 26 hours of EEG recording, interpretation and report after each 24-hour period; with video (VEEG)* (work RVU= 3.86, total time of 75 minutes), agreeing that although the reference code involves slightly more total time, both services involve a comparable amount of physician work. The RUC recommends 80 minutes total time.

In support of the crosswalk value, the RUC also compared the surveyed code to top key reference code 99205 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter* (work RVU= 3.50, total time of 88 minutes) and concurred that 99255 should be valued higher based on a slightly higher intensity relative to 99205 and referenced that 83% of the survey respondents that selected this top key reference service had indicated that 99255 is more intense/complex. The specialties noted, and the RUC concurred, that inpatient consultation codes should be valued somewhat higher than the office or other outpatient new patient visit with the same level of medical decision making to account for the more acute work in the inpatient setting and the work of generating and sending a written report to the requesting physician. The report provides recommendations for the management of the patient and identify additional labs, imaging and/or tests to perform. The specialties also noted that a consultation typically involves a greater amount of data to review at the high-level decision-making level relative to new patient office visit code 99205. **The RUC recommends a work RVU of 3.86 for CPT code 99255.**

CPT Descriptor Time for Inpatient Consultations

The RUC recommends the following total times on the date of encounter for the outpatient consultation CPT descriptors based on the survey medians. The times in the CPT descriptors are rounded or incremental between this family of services for the ease of those who may report these services based on time.

CPT Code		Time on the Date of Encounter Recommendation to CPT
99252	Inpatient or Observation Consultation, new or est pt, straightforward MDM	35
99253	Inpatient or Observation Consultation, new or est pt, low MDM	45
99254	Inpatient or Observation Consultation, new or est pt, moderate MDM	60
99255	Inpatient or Observation Consultation, new or est pt, high MDM	80

Practice Expense

The RUC recommends no direct practice expense inputs for CPT codes 99252-99255 as they are facility-only services.

Work Neutrality
Based on the 2009 Medicare utilization data from when these services were last covered by Medicare, the RUC's recommendation for this family of codes would result in an overall work savings.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Evaluation and Management **Consultations** A consultation is a type of evaluation and management service provided at the request of another physician, other qualified health care professional, or appropriate source to ~~either~~ recommend care for a specific condition or problem ~~or to determine whether to accept responsibility for ongoing management of the patient's entire care or for the care of a specific condition or problem~~. A physician or other qualified health care professional consultant may initiate diagnostic and/or therapeutic services at the same or subsequent visit. A "consultation" initiated by a patient and/or family, and not requested by a physician, other qualified health care professional, or other appropriate source (eg, ~~physician assistant, nurse practitioner, doctor of chiropractic, physical therapist, occupational therapist, speech-language pathologist, psychologist,~~ non-clinical social worker, educator, lawyer, or insurance company), is not reported using the consultation codes ~~but may be reported using the office visit, home service, or domiciliary/rest home care codes as appropriate~~. ~~The written or verbal request for consult may be made by a physician or other appropriate source and documented in the patient's medical record by either the consulting or requesting physician or appropriate source.~~ The consultant's opinion and any services that were ordered or performed must also be ~~documented in the patient's medical record and~~ communicated by written report to the requesting physician, other qualified health care professional, or other appropriate source. *If a consultation is mandated (eg, by a third-party payer) modifier 32 should also be reported.* ~~Any specifically identifiable procedure (ie, identified with a specific CPT code) performed on or subsequent to the date of the initial consultation should be reported separately.~~ ~~If subsequent to the completion of a consultation the consultant assumes responsibility for management of a portion or all of the patient's condition(s), the appropriate **Evaluation and Management** services code for the site of service should be reported. In the hospital or nursing facility setting, the consultant should use the appropriate inpatient consultation code for the initial encounter and then subsequent hospital or nursing facility care codes. In the office setting, the consultant should use the appropriate office or other outpatient consultation codes and then the established patient office or other outpatient services codes.~~				

To report services when ~~provided to~~ a patient ~~who~~ is admitted to ~~a~~ hospital inpatient, or observation status, or to a nursing facility in the course of an encounter in another setting ~~the office or other ambulatory facility~~, see ~~the notes for~~ **Initial Hospital Inpatient or Observation Care** ~~(page 23)~~ or **Initial Nursing Facility Care** ~~(page 33)~~.

For definitions of ~~key components and~~ commonly used terms, ~~please~~ see **Evaluation and Management Services Guidelines.**

~~***Coding Tip***~~

~~**Definition of Transfer of Care**~~

~~Transfer of care is the process whereby a physician or other qualified health care professional who is providing management for some or all of a patient's problems relinquishes this responsibility to another physician or other qualified health care professional who explicitly agrees to accept this responsibility and who, from the initial encounter, is not providing consultative services. The physician or other qualified health care professional transferring care is then no longer providing care for these problems though he or she may continue providing care for other conditions when appropriate. Consultation codes should not be reported by the physician or other qualified health care professional who has agreed to accept transfer of care before an initial evaluation but are appropriate to report if the decision to accept transfer of care cannot be made until after the initial consultation evaluation, regardless of site of service.~~

~~CPT Coding Guidelines, Evaluation and Management, Guidelines Common to All E/M Services, Concurrent Care and Transfer of Care~~

Inpatient or Observation Consultations
New or Established Patient

~~The following~~ ~~c~~Codes 99252, 99253, 99254, 99255 are used to report physician or other qualified health care professional consultations provided to hospital inpatients, observation level patients, residents of nursing facilities, or patients in a partial hospital setting and when the patient has not received any face-to-face professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice during the stay. When advanced practice nurses and physician assistants are working with physicians they are considered as working in the exact same specialty and subspecialty as the physician.

Only one consultation ~~should~~ may be reported by a consultant per admission. Subsequent consultation services during the same admission are reported using subsequent hospital inpatient or observation care codes (99231-99233) or subsequent nursing facility care codes (99307-99310).~~,~~ ~~including services to complete the initial consultation, monitor progress, revise recommendations, or address a new problem.~~ ~~Use subsequent hospital care codes (99231-99233) or subsequent nursing facility care codes (99307-99310) to report transfer of care services (see page 5, Concurrent Care and Transfer of Care definitions).~~

~~When an inpatient consultation is performed on a date that a patient is admitted to a hospital or nursing facility all evaluation and management services provided by the consultant related to the admission are reported with the inpatient consultation service code (99251-99255). If a patient is admitted after an outpatient consultation (office, emergency department, etc), and the patient is not seen on the unit on the date of admission, only report the outpatient consultation code (99241-99245). If the patient is seen by the consultant on the unit on the date of admission, report all evaluation and management services provided by the consultant related to the admission with either the inpatient consultation code (99251-99255) or with the initial inpatient admission service code (99221-99223). Do not report both an outpatient consultation (99241-99245) and inpatient consultation (99251-99255) for services related to the same inpatient stay. When transfer of care services are provided on a date subsequent to the outpatient consultation, use the subsequent hospital care codes (99231-99233) or subsequent nursing facility care codes (99307-99310).~~

(For an inpatient or observation consultation requiring prolonged services, use 993X0)

~~99251~~	-	~~**Inpatient consultation** for a new or established patient, which requires these 3 key components:~~ ~~• **A problem focused history;**~~ ~~• **A problem focused examination; and**~~ ~~• **Straightforward medical decision making.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are self limited or minor. Typically, 20 minutes are spent at the bedside and on the patient's hospital floor or unit.~~ (99251 has been deleted. To report, use 99252)	~~XXX~~	~~N/A~~
▲99252	G5	**Inpatient or observation consultation** for a new or established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. ~~these 3 key components:~~ ~~• **An expanded problem focused history;**~~ ~~• **An expanded problem focused examination; and**~~ ~~• **Straightforward medical decision making.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of low severity. Typically, 40 minutes are spent face-to-face with the patient and/or family.~~ When using total time on the date of the encounter for code selection, 35 minutes must be met or exceeded.	XXX	1.50 (No Change)

▲99253	G6	**Inpatient or observation consultation** for a new or established patient, which requires t a medically appropriate history and/or examination and low level of medical decision making. ~~these 3 key components:~~ • ~~**A detailed history;**~~ • ~~**A detailed examination; and**~~ • ~~**Medical decision making of low complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of moderate severity. ▲99254	G7	**Inpatient <u>or observation</u> consultation** for a new or established patient, which requires <u>a medically appropriate history and/or examination and moderate level of medical decision making.</u> ~~these 3 key components:~~ • ~~**A comprehensive history;**~~ • ~~**A comprehensive examination; and**~~ • ~~**Medical decision making of moderate complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of moderate to high severity. Typically, 80 minutes are spent face-to-face with the patient and/or family.~~ <u>When using total time on the date of the encounter for code selection, 60 minutes must be met or exceeded.</u>	XXX	2.72

▲99255	G8	**Inpatient or observation consultation** for a new or established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. ~~these 3 key components:~~ • ~~**A comprehensive history;**~~ • ~~**A comprehensive examination; and**~~ • ~~**Medical decision making of high complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of moderate to high severity. Typically, 110 minutes are spent face-to-face with the patient and/or family.~~ When using total time on the date of the encounter for code selection, 80 minutes must be met or exceeded. (For services 95 minutes or longer, use prolonged services code 993X0)	XXX	3.86

CPT 2023 E/M Guidelines

Category I
Evaluation and Management (E/M) Services Guidelines

In addition to the information presented in the Introduction, several other items unique to this section are defined or identified here.

E/M Guidelines Overview

The E/M guidelines have sections that are common to all E/M categories and sections that are category specific. Most of the categories and many of the subcategories of service have special guidelines or instructions unique to that category or subcategory. Where these are indicated, eg, "Hospital Inpatient and Observation Care," special instructions are presented before the listing of the specific E/M services codes. It is important to review the instructions for each category or subcategory. These guidelines are to be used by the reporting physician or other qualified health care professional to select the appropriate level of service. These guidelines do not establish documentation requirements or standards of care. The main purpose of documentation is to support care of the patient by current and future health care team(s). These guidelines are for services that require a face-to-face encounter. (For 99211 and 99281 the face-to-face services may be performed by clinical staff).

In the **Evaluation and Management** section (99202-99499) there are many code categories. Each category may have specific guidelines, or the codes may include specific details. These E/M guidelines are written for the following categories:

- Office or Other Outpatient Services
- Hospital Inpatient and Observation Care Services
- Consultations
- Emergency Department Services
- Nursing Facility Services
- Home and Residence Services
- Prolonged Service With or Without Direct Contact on the Date of an Evaluation and Management Service

Classification of Evaluation and Management (E/M) Services

The E/M section is divided into broad categories such as office visits, hospital inpatient or observation care visits, and consultations. Most of the categories are further divided into two or more subcategories of E/M services. For example, there are two subcategories of office visits (new patient and established patient) and there are two subcategories of hospital inpatient and observation care visits (initial and subsequent). The subcategories of E/M services are further classified into levels of E/M services that are identified by specific codes.

The basic format of codes with levels of E/M services based on medical decision making (MDM) or time is the same. First, a unique code number is listed. Second, the place and/or type of service is specified, eg, office or other outpatient visit. Third, the content of the service is defined. Fourth, time is specified. (A detailed discussion of time is provided following the Decision Tree for New vs Established Patients.)

The place of service and service type is defined by the location where the face-to-face encounter occurs. For example, service provided to a nursing facility resident brought to the office is reported with an office or other outpatient code.

New and Established Patients

Solely for the purposes of distinguishing between new and established patients, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. A new patient is one who has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years.

An established patient is one who has received professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years. See Decision Tree for New vs Established Patients.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient's encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

No distinction is made between new and established patients in the emergency department. E/M services in the emergency department category may be reported for any new or established patient who presents for treatment in the emergency department.

The Decision Tree for New vs Established Patients is provided to aid in determining whether to report the E/M service provided as a new or an established patient encounter.

Coding Tip

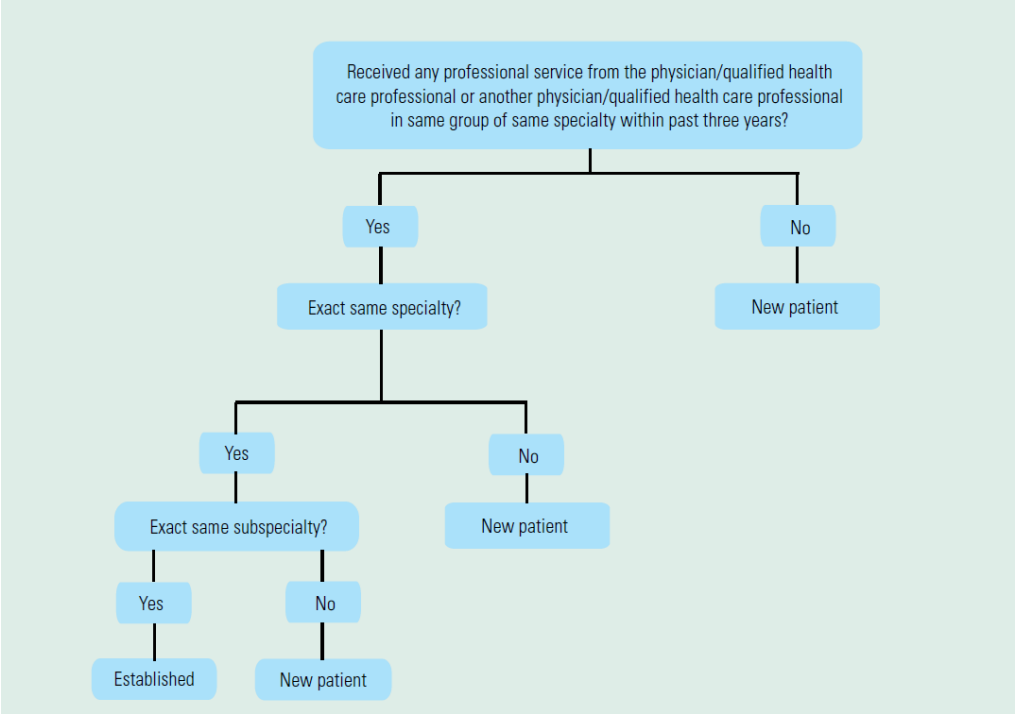
Instructions for Use of the CPT Codebook

When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and exact same subspecialty as the physician. A "physician or other qualified health care professional" is an individual who is qualified by education, training, licensure/regulation (when applicable), and facility privileging (when applicable) who performs a professional service within his or her scope of practice and independently reports that professional service. These professionals are distinct from "clinical staff." A clinical staff member is a person who works under the supervision of a physician or other qualified health care professional, and who is allowed by law, regulation and facility policy to perform or assist in the performance of a specific professional service but does not individually report that professional service. Other policies may also affect who may report specific services.

CPT Coding Guidelines, Introduction, Instructions for Use of the CPT Codebook

---

Decision Tree for New vs Established Patients



Initial and Subsequent Services

Some categories apply to both new and established patients (eg, hospital inpatient or observation care). These categories differentiate services by whether the service is the initial service or a subsequent service. For the purpose of distinguishing between initial or subsequent visits, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. An initial service is when the patient has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the inpatient or observation or nursing facility admission and stay.

A subsequent service is when the patient has received professional service(s) from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the admission and stay.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient's encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

For reporting hospital inpatient or observation care services, a stay that includes a transition from observation to inpatient is a single stay. For reporting nursing facility services, a stay that includes transition(s) between skilled nursing facility and nursing facility level of care is the same stay.

Services Reported Separately

Any specifically identifiable procedure or service (ie, identified with a specific CPT code) performed on the date of E/M services may be reported separately.

The ordering and actual performance and/or interpretation of diagnostic tests/studies during a patient encounter are not included in determining the levels of E/M services when the professional interpretation

of those tests/studies is reported separately by the physician or other qualified health care professional reporting the E/M service. Tests that do not require separate interpretation (eg, tests that are results only) and are analyzed as part of MDM do not count as an independent interpretation and may be counted as ordered or reviewed for selecting an MDM level.

The performance of diagnostic tests/studies for which specific CPT codes are available may be reported separately, in addition to the appropriate E/M code. The interpretation of the results of diagnostic tests/studies (ie, professional component) with preparation of a separate distinctly identifiable signed written report may also be reported separately, using the appropriate CPT code and, if required, with modifier 26 appended.

See Instructions for Selecting a Level Based on MDM or Time.

The physician or other qualified health care professional may need to indicate that on the day a procedure or service identified by a CPT code was performed, the patient's condition required a significant separately identifiable E/M service. The E/M service may be caused or prompted by the symptoms or condition for which the procedure and/or service was provided. This circumstance may be reported by adding modifier 25 to the appropriate level of E/M service. As such, different diagnoses are not required for reporting of the procedure and the E/M services on the same date.

History and/or Examination

These E/M services include a medically appropriate history and/or physical examination, when performed. The nature and extent of the history and/or physical examination are determined by the treating physician or other qualified health care professional reporting the service. The care team may collect information, and the patient or caregiver may supply information directly (eg, by electronic health record [EHR] portal or questionnaire) that is reviewed by the reporting physician or other qualified health care professional. The extent of history and physical examination is not an element in selection of the level of these E/M service codes.

Levels of E/M Services

Select the appropriate level of E/M services based on the following:

1. The level of the MDM as defined for each service, **or**

2. The total time for E/M services performed on the date of the encounter.

Within each category or subcategory of E/M service based on MDM or time, there are three to five levels of E/M services available for reporting purposes. Levels of E/M services are **not** interchangeable among the different categories or subcategories of service. For example, the first level of E/M services in the subcategory of office visit, new patient, does not have the same definition as the first level of E/M services in the subcategory of office visit, established patient. Each level of E/M services may be used by all physicians or other qualified health care professionals.

Guidelines for Selecting a level service based on Medical Decision Making

Four types of MDM are recognized: straightforward, low, moderate, and high. The concept of the level of MDM does not apply to 99211 or 99281.

MDM includes establishing diagnoses, assessing the status of a condition, and/or selecting a management option. MDM is defined by three elements. The elements are:

- ***The number and complexity of problem(s) that are addressed during the encounter***.
- ***The amount and/or complexity of data to be reviewed and analyzed.*** These data include medical records, tests, and/or other information that must be obtained, ordered, reviewed, and analyzed for the encounter. This includes information obtained from multiple sources or interprofessional communications that are not reported separately and interpretation of tests that are not reported

separately. Ordering a test is included in the category of test result(s) and the review of the test result is part of the encounter and not a subsequent encounter. Ordering a test may include those considered, but not selected after shared decision making. For example, a patient may request diagnostic imaging that is not necessary for their condition and discussion of the lack of benefit may be required. Alternatively, a test may normally be performed, but due to risk for a specific patient is not ordered. These considerations must be documented. Data are divided into three categories:

- Tests, documents, orders, or independent historian(s). (Each unique test, order, or document is counted to meet a threshold number.)
- Independent interpretation of tests (not separately reported)
- Discussion of management or test interpretation with external physician or other qualified health care professional or appropriate source (not separately reported)

- **The risk of complications and/or morbidity or mortality of patient management:** This includes decisions made at the encounter associated with the diagnostic procedure(s) and treatment(s). This includes the possible management options selected and those considered but not selected, after shared decision making with the patient and/or family. For example, a decision about hospitalization includes consideration of alternative levels of care. Examples may include a psychiatric patient with a sufficient degree of support in the outpatient setting or the decision to not hospitalize a patient with advanced dementia with an acute condition that would generally warrant inpatient care, but for whom the goal is palliative treatment.

Shared decision making involves eliciting patient and/or family preferences, patient and/or family education, and explaining risks and benefits of management options.

MDM may be impacted by role and management responsibility.

When the physician or other qualified health care professional is reporting a separate CPT code that includes interpretation and/or report, the interpretation and/or report is not counted toward the MDM when selecting a level of E/M services.

When the physician or other qualified health care professional is reporting a separate service for discussion of management with a physician or another qualified health care professional, the discussion is not counted toward the MDM when selecting a level of E/M services.

The Levels of Medical Decision Making (MDM) table (Table 2) is a guide to assist in selecting the level of MDM for reporting an E/M services code. The table includes the four levels of MDM (ie, straightforward, low, moderate, high) and the three elements of MDM (ie, number and complexity of problems addressed at the encounter, amount and/or complexity of data reviewed and analyzed, and risk of complications and/or morbidity or mortality of patient management). To qualify for a particular level of MDM, two of the three elements for that level of MDM must be met or exceeded.

Examples in the table may be more or less applicable to specific settings of care. For example, the decision to hospitalize applies to the outpatient or nursing facility encounters, whereas the decision to escalate hospital level of care (eg, transfer to ICU) applies to the hospitalized or observation care patient.

See also the introductory guidelines of each code family section.

Table 2: Levels of Medical Decision Making (MDM)

Level of MDM (Based on 2 out of 3 Elements of MDM)	Elements of Medical Decision Making		
	Number and Complexity of Problems Addressed at the Encounter	Amount and/or Complexity of Data to be Reviewed and Analyzed **Each unique test, order, or document contributes to the combination of 2 or combination of 3 in Category 1 below.*	Risk of Complications and/or Morbidity or Mortality of Patient Management
N/A	N/A	N/A	N/A
Straightforward	Minimal • 1 self-limited or minor problem	Minimal or none	Minimal risk of morbidity from additional diagnostic testing or treatment
Low	Low • 2 or more self-limited or minor problems; or • 1 stable, chronic illness; or • 1 acute, uncomplicated illness or injury or • 1 stable acute illness or • 1 acute, uncomplicated illness or injury requiring hospital inpatient or observation level of care	Limited *(Must meet the requirements of at least 1 of the 2 categories*) Category 1: Tests and documents • Any combination of 2 from the following: ○ Review of prior external note(s) from each unique source*; ○ Review of the result(s) of each unique test*; ○ Ordering of each unique test* or Category 2: Assessment requiring an independent historian(s) *(For the categories of independent interpretation of tests and discussion of management or test interpretation, see moderate or high)*	Low risk of morbidity from additional diagnostic testing or treatment

Moderate	Moderate
	• 1 or more chronic illnesses with exacerbation, progression, or side effects of treatment;
	or
	• 2 or more stable, chronic illnesses;
	or
	• 1 undiagnosed new problem with uncertain prognosis;
	or
	• 1 acute illness with systemic symptoms;
	or
	• 1 acute, complicated injury
		Moderate
		(Must meet the requirements of at least 1 out of 3 categories)
		Category 1: Tests, documents, or independent historian(s)
		• Any combination of 3 from the following:
		  ○ Review of prior external note(s) from each unique source*;
		  ○ Review of the result(s) of each unique test*;
		  ○ Ordering of each unique test*;
		  ○ Assessment requiring an independent historian(s)
		or
		Category 2: Independent interpretation of tests
		• Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);
		or
		Category 3: Discussion of management or test interpretation
		• Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)
			Moderate risk of morbidity from additional diagnostic testing or treatment
			
			Examples only:
			• Prescription drug management
			• Decision regarding minor surgery with identified patient or procedure risk factors
			• Decision regarding elective major surgery without identified patient or procedure risk factors
			• Diagnosis or treatment significantly limited by social determinants of health

High	High
	• 1 or more chronic illnesses with severe exacerbation, progression, or side effects of treatment;
	or
	• 1 acute or chronic illness or injury that poses a threat to life or bodily function
		Extensive
		(Must meet the requirements of at least 2 out of 3 categories)
		
		Category 1: Tests, documents, or independent historian(s)
		• Any combination of 3 from the following:
		  ○ Review of prior external note(s) from each unique source*;
		  ○ Review of the result(s) of each unique test*;
		  ○ Ordering of each unique test*;
		  ○ Assessment requiring an independent historian(s)
		or
		Category 2: Independent interpretation of tests
		• Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);
		or
		Category 3: Discussion of management or test interpretation
		• Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)
			High risk of morbidity from additional diagnostic testing or treatment
			
			Examples only:
			• Drug therapy requiring intensive monitoring for toxicity
			• Decision regarding elective major surgery with identified patient or procedure risk factors
			• Decision regarding emergency major surgery
			• Decision regarding hospitalization or escalation of hospital-level of care
			• Decision not to resuscitate or to de-escalate care because of poor prognosis
			• Parenteral controlled substances

Number and Complexity of Problems Addressed at the Encounter

One element used in selecting the level of services is the number and complexity of the problems that are addressed at the encounter. Multiple new or established conditions may be addressed at the same time and may affect MDM. Symptoms may cluster around a specific diagnosis and each symptom is not necessarily a unique condition. Comorbidities and underlying diseases, in and of themselves, are not considered in selecting a level of E/M services **unless** they are addressed, and their presence increases the amount and/or complexity of data to be reviewed and analyzed or the risk of complications and/or morbidity or mortality of patient management. The final diagnosis for a condition does not, in and of itself, determine the complexity or risk, as extensive evaluation may be required to reach the conclusion that the signs or symptoms do not represent a highly morbid condition. Therefore, presenting symptoms which are likely to represent a highly morbid condition may drive MDM even when the ultimate diagnosis is not highly morbid. The evaluation and /or treatment should be consistent with the likely nature of the condition. Multiple problems of a lower severity may, in the aggregate, create higher risk due to interaction.

The term "risk" as used in these definitions relates to risk from the condition. While condition risk and management risk may often correlate, the risk from the condition is distinct from the risk of the management.

Definitions for the elements of MDM (see Table 2, Levels of Medical Decision Making) are:

Problem: *A problem is a disease, condition, illness, injury, symptom, sign, finding, complaint, or other matter addressed at the encounter, with or without a diagnosis being established at the time of the encounter.*

Problem addressed: A problem is addressed or managed when it is evaluated or treated at the encounter by the physician or other qualified health care professional reporting the service. This includes consideration of further testing or treatment that may not be elected by virtue of risk/benefit analysis or patient/parent/guardian/surrogate choice. Notation in the patient's medical record that another professional is managing the problem without additional assessment or care coordination documented does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. Referral without evaluation (by history, examination, or diagnostic study[ies]) or consideration of treatment does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. For hospital inpatient and observation care services, the problem addressed is the problem status on the date of the encounter, which may be significantly different than on admission. It is the problem being managed or co-managed by the reporting physician or qualified health care professional and may not be the cause of admission or continued stay.

Minimal problem: A problem that may not require the presence of the physician or other qualified health care professional, but the service is provided under the physician's or other qualified health care professional's supervision (see 99211, 99281).

Self-limited or minor problem: *A problem that runs a definite and prescribed course, is transient in nature, and is not likely to permanently alter health status.*

Stable, chronic illness: A problem with an expected duration of at least one year or until the death of the patient. For the purpose of defining chronicity, conditions are treated as chronic whether or not stage or severity changes (eg, uncontrolled diabetes and controlled diabetes are a single chronic condition). "Stable" for the purposes of categorizing MDM is defined by the specific treatment goals for an individual patient. A patient who is not at his or her treatment goal is not stable, even if the condition has not changed and there is no short-term threat to life or function. For example, a patient with persistently poorly controlled blood pressure for whom better control is a goal is not stable, even if the pressures are not changing and the patient is asymptomatic. The risk of morbidity **without** treatment is significant.

Acute, uncomplicated illness or injury: A recent or new short-term problem with low risk of morbidity for which treatment is considered. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. A problem that is normally self-limited or minor but is not resolving consistent with a definite and prescribed course is an acute, uncomplicated illness.

Acute, uncomplicated illness or injury requiring hospital inpatient or observation level care: A recent or new short-term problem with low risk of morbidity for which treatment is required. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. The treatment required is delivered in a hospital inpatient or observation level setting.

Stable, acute illness: A problem that is new or recent for which treatment has been initiated. The patient is improved and while resolution may not be complete is stable with respect to this condition.

Chronic illness with exacerbation, progression, or side effects of treatment: A chronic illness that is acutely worsening, poorly controlled, or progressing with an intent to control progression and requiring additional supportive care or requiring attention to treatment for side effects.

Undiagnosed new problem with uncertain prognosis: A problem in the differential diagnosis that represents a condition likely to result in a high risk of morbidity without treatment.

Acute illness with systemic symptoms: An illness that causes systemic symptoms and has a high risk of morbidity without treatment. For systemic general symptoms, such as fever, body aches, or fatigue in a minor illness that may be treated to alleviate symptoms, see the definitions for **self-limited or minor problem** or **acute, uncomplicated illness or injury.** Systemic symptoms may not be general but may be single system.

Acute, complicated injury: An injury which requires treatment that includes evaluation of body systems that are not directly part of the injured organ, the injury is extensive, or the treatment options are multiple and/or associated with risk of morbidity.

Chronic illness with severe exacerbation, progression, or side effects of treatment: The severe exacerbation or progression of a chronic illness or severe side effects of treatment that have significant risk of morbidity and may require escalation in level of care.

Acute or chronic illness or injury that poses a threat to life or bodily function: An acute illness with systemic symptoms, an acute complicated injury, or a chronic illness or injury with exacerbation and/or progression or side effects of treatment, that poses a threat to life or bodily function in the near term without treatment. Some symptoms may represent a condition that is significantly probable and poses a potential threat to life or bodily function. These may be included in this category when the evaluation and treatment is consistent with this degree of potential severity.

Amount and/or Complexity of Data to be Reviewed and Analyzed

One element used in selecting the level of services is the amount and/or complexity of data to be reviewed or analyzed at an encounter.

Analyzed: Analyzed is a term describing the process of using the data as part of the MDM. The data element itself may not be subject to analysis (eg, glucose), but it is instead included in the thought processes for diagnosis, evaluation, or treatment. Tests ordered are presumed to be analyzed when the results are reported. Therefore, when they are ordered during an encounter, they are counted in that encounter. Tests that are ordered outside of an encounter may be counted in the encounter where they are analyzed. In the case of a recurring order, each new result may be counted in the encounter at which it is analyzed. For example, an encounter that includes an order for monthly prothrombin times would count for one prothrombin time ordered and reviewed. Additional future results, if analyzed in a subsequent encounter, may be counted as a single test in that subsequent encounter. Any service for which the professional component is separately reported by the physician or other qualified health care professional

reporting the E/M services is not counted as a data element ordered, reviewed, analyzed, or independently interpreted for the purposes of determining the level of MDM.

Test: Tests are imaging, laboratory, psychometric, or physiologic data. A clinical laboratory panel (eg, basic metabolic panel [80047]) is a single test. The differentiation between single or multiple tests is defined in accordance with the CPT code set. For the purposes of data reviewed and analyzed, pulse oximetry is not a test.

Unique: A unique test is defined by the CPT code set. When multiple results of the same unique test (eg, serial blood glucose values) are compared during an E/M service, only count one unique test. Tests that have overlapping elements are not unique, even if they are identified with distinct CPT codes. For example, a CBC with differential would incorporate the set of hemoglobin, CBC without differential, and platelet count. A unique source is defined as a physician or qualified heath care professional in a distinct group or different specialty or subspecialty, or a unique entity. Review of all materials from any unique source counts as one element towards MDM.

Combination of Data Elements: A combination of different data elements, for example a combination of notes reviewed, tests ordered, tests reviewed, or independent historian, allows these elements to be summed. It does not require each item type or category to be represented. A unique test ordered, plus a note reviewed and an independent historian would be a combination of three elements.

External: *External records, communications and/or test results are from an external physician, other qualified health care professional, facility, or health care organization.*

External physician or other qualified health care professional: *An external physician or other qualified health care professional who is not in the same group practice or is of a different specialty or subspecialty. This includes licensed professionals who are practicing independently. The individual may also be a facility or organizational provider such as from a hospital, nursing facility, or home health care agency.*

Discussion: Discussion requires an interactive exchange. The exchange must be direct and not through intermediaries (eg, clinical staff or trainees). Sending chart notes or written exchanges that are within progress notes does not qualify as an interactive exchange. The discussion does not need to be on the date of the encounter but is counted only once and only when it is used in the decision making of the encounter. It may be asynchronous (ie, does not need to be in person), but it must be initiated and completed within a short time period (eg, within a day or two).

Independent historian(s): An individual (eg, parent, guardian, surrogate, spouse, witness) who provides a history in addition to a history provided by the patient who is unable to provide a complete or reliable history (eg, due to developmental stage, dementia, or psychosis) or because a confirmatory history is judged to be necessary. In the case where there may be conflict or poor communication between multiple historians and more than one historian is needed, the independent historian requirement is met. It does not include translation services. The independent history does not need to be obtained in person but does need to be obtained directly from the historian providing the independent information.

Independent interpretation: The interpretation of a test for which there is a CPT code, and an interpretation or report is customary. This does not apply when the physician or other qualified health care professional who reports the E/M service is reporting or has previously reported the test. A form of interpretation should be documented but need not conform to the usual standards of a complete report for the test.

Appropriate source: *For the purpose of the* ***discussion of management*** *data element (see Table 2, Levels of Medical Decision Making), an appropriate source includes professionals who are not health care professionals but may be involved in the management of the patient (eg, lawyer, parole officer, case manager, teacher). It does not include discussion with family or informal caregivers.*

Risk of Complications and/or Morbidity or Mortality of Patient Management

One element used in selecting the level of services is the risk of complications and/or morbidity or mortality of patient management at an encounter. This is distinct from the risk of the condition itself.

Risk: The probability and/or consequences of an event. The assessment of the level of risk is affected by the nature of the event under consideration. For example, a low probability of death may be high risk, whereas a high chance of a minor, self-limited adverse effect of treatment may be low risk. Definitions of risk are based upon the usual behavior and thought processes of a physician or other qualified health care professional in the same specialty. Trained clinicians apply common language usage meanings to terms such as high, medium, low, or minimal risk and do not require quantification for these definitions (though quantification may be provided when evidence-based medicine has established probabilities). For the purposes of MDM, level of risk is based upon consequences of the problem(s) addressed at the encounter when appropriately treated. Risk also includes MDM related to the need to initiate or forego further testing, treatment, and/or hospitalization. The risk of patient management criteria applies to the patient management decisions made by the reporting physician or other qualified health care professional as part of the reported encounter.

Morbidity: *A state of illness or functional impairment that is expected to be of substantial duration during which function is limited, quality of life is impaired, or there is organ damage that may not be transient despite treatment.*

Social determinants of health: *Economic and social conditions that influence the health of people and communities. Examples may include food or housing insecurity.*

Surgery (minor or major, elective, emergency, procedure or patient risk):

> ***Surgery-Minor or Major:*** The classification of surgery into minor or major is based upon the common meaning of such terms when used by trained clinicians, similar to the use of the term "risk". These terms are not defined by a surgical package classification.
>
> ***Surgery-Elective or Emergency:*** Elective procedures and emergent or urgent procedures describe the timing of a procedure when the timing is related to the patient's condition. An elective procedure is typically planned in advance (eg, scheduled for weeks later), while an emergent procedure is typically performed immediately or with minimal delay to allow for patient stabilization. Both elective and emergent procedures may be minor or major procedures.
>
> ***Surgery-Risk Factors, Patient or Procedure:*** Risk factors are those that are relevant to the patient and procedure. Evidence-based risk calculators may be used, but are not required, in assessing patient and procedure risk.

Drug therapy requiring intensive monitoring for toxicity: A drug that requires intensive monitoring is a therapeutic agent that has the potential to cause serious morbidity or death. The monitoring is performed for assessment of these adverse effects and not primarily for assessment of therapeutic efficacy. The monitoring should be that which is generally accepted practice for the agent but may be patient-specific in some cases. Intensive monitoring may be long-term or short-term. Long-term intensive monitoring is not performed less than quarterly. The monitoring may be performed with a laboratory test, a physiologic test, or imaging. Monitoring by history or examination does not qualify. The monitoring affects the level of MDM in an encounter in which it is considered in the management of the patient. An example may be monitoring for cytopenia in the use of an antineoplastic agent between dose cycles. Examples of monitoring that do not qualify include monitoring glucose levels during insulin therapy, as the primary reason is the therapeutic effect (unless severe hypoglycemia is a current, significant concern); or annual electrolytes and renal function for a patient on a diuretic, as the frequency does not meet the threshold.

Guidelines for Selecting Level of Service Based on Time

Certain categories of time-based E/M codes that do not have levels of services based on MDM (eg, Critical Care Services) in the E/M section use time differently. It is important to review the instructions for each category.

Time is **not** a descriptive component for the emergency department levels of E/M services because emergency department services are typically provided on a variable intensity basis, often involving multiple encounters with several patients over an extended period of time.

When time is used for reporting E/M services codes, the time defined in the service descriptors is used for selecting the appropriate level of services. The E/M services for which these guidelines apply require a face-to-face encounter with the physician or other qualified health care professional. For office or other outpatient services, if the physician's or other qualified health care professional's time is spent in the supervision of clinical staff who perform the face-to-face services of the encounter, use 99211.

For coding purposes, time for these services is the total time on the date of the encounter. It includes both the face-to-face and non-face-to-face time personally spent by the physician and/or other qualified health care professional(s) on the day of the encounter (includes time in activities that require the physician or other qualified health care professional and does not include time in activities normally performed by clinical staff). It does not include any time spent in the performance of other separately reported service(s).

A shared or split visit is defined as a visit in which a physician and other qualified health care professional(s) both provide the face-to-face and non-face-to-face work related to the visit. When time is being used to select the appropriate level of services for which time-based reporting of shared or split visits is allowed, the time personally spent by the physician and other qualified health care professional(s) assessing and managing the patient on the date of the encounter is summed to define total time. Only distinct time should be summed for shared or split visits (ie, when two or more individuals jointly meet with or discuss the patient, only the time of one individual should be counted).

When prolonged time occurs, the appropriate prolonged services code may be reported. The total time on the date of the encounter spent caring for the patient should be documented in the medical record when it is used as the basis for code selection.

Physician or other other qualified health care professional time includes the following activities, when performed:

- preparing to see the patient (eg, review of tests)
- obtaining and/or reviewing separately obtained history
- performing a medically appropriate examination and/or evaluation
- counseling and educating the patient/family/caregiver
- ordering medications, tests, or procedures
- referring and communicating with other health care professionals (when not separately reported)
- documenting clinical information in the electronic or other health record
- independently interpreting results (when not separately reported) and communicating results to the patient family/caregiver
- care coordination (when not separately reported)

Do not count time spent on the following:

- the performance of other services reported separately

- travel
- teaching that is general and not limited to discussion that is required for the management of the specific patient

Unlisted Service

An E/M service may be provided that is not listed in this section of the CPT codebook. When reporting such a service, the appropriate unlisted code may be used to indicate the service, identifying it by "Special Report," as discussed in the following paragraph. The "Unlisted Services" and accompanying codes for the E/M section are as follows:

***99429 Unlisted preventive** medicine service*

***99499 Unlisted evaluation and management** service*

Special Report

An unlisted service or one that is unusual, variable, or new may require a special report demonstrating the medical appropriateness of the service. Pertinent information should include an adequate definition or description of the nature, extent, and need for the procedure and the time, effort, and equipment necessary to provide the service. Additional items that may be included are complexity of symptoms, final diagnosis, pertinent physical findings, diagnostic and therapeutic procedures, concurrent problems, and follow-up care.

December 14, 2021

To: Ezequiel Silva III, MD
Chair, AMA/Specialty Society RVU Update Committee (RUC)

From: Survey Societies for Inpatient Consultation Codes

Re: Tab 14, Supplemental Information

When compared with the prior October 2021 survey, additional text and questions were added to the survey instrument by the Research Subcommittee. On behalf of the surveying societies, a discussion of each survey revision and additional questions is provided below, along with additional survey statistics, for information.

1. *A new question (highlighted in red below) was added by the Research Subcommittee following the question about whether the vignette describes a typical patient. This is the first time that this question has been included in an E/M survey. The statistics from this survey question are presented below for informational purposes. We do not believe, however, that any conclusion can be drawn from these data because this question was placed after the "typical patient" question and not in the context of total time on the date of encounter (ie, Question 2B). It is possible that some respondents may have interpreted this question to ask if only one physician/QHP is responsible for the typical patient on a given day, independent of the specialty. Said another way, the question does not specify whether the response should be reflective of more than one physician/QHP in a group that is reporting a single code on a date.*

On a single calendar day, will there typically (ie, more than 50% of the time) be more than one physician/QHP who spends time providing CPT code <auto populate> for the typical patient described above?

	99252		99253		99254		99255	
Yes	81	40%	105	48%	166	71%	161	72%
No	124	60%	114	52%	68	29%	62	28%

2. *When compared with the prior survey, additional text was added to the general background information to make it clear that: the code changes will not be effective until 2023; the codes will include both inpatient and observation consultations; and all time on the date of encounter is included—not just unit/floor time.*

Background for Question 2 [Revised text highlighted in red]

Physician/other qualified health care professional time includes the following activities, when performed, whether on or off the unit/floor:

- preparing to see the patient (eg, review of tests)
- obtaining and/or reviewing separately obtained history
- performing a medically appropriate examination and/or evaluation
- counseling and educating the patient/family/caregiver
- ordering medications, tests or procedures
- referring and communicating with other health care professionals (when not separately reported)
- documenting clinical information in the electronic or other health record
- independently interpreting results (when not separately reported) and communicating results to the patient family/caregiver
- care coordination (when not separately reported)

DO NOT include time for work related to another service, procedure, or evaluation and management code that is separately reportable.

"Physician work" does not include the services provided by support staff who are employed by your practice and cannot bill separately, including registered nurses, licensed practical nurses, medical assistants, receptionists, or technicians; these services are included in the practice expense relative values, a different component of the Resource-Based Relative Value Scale (RBRVS).

When total time on the date of encounter is used to select the appropriate level of an inpatient and observation consultation service code, both the face-to-face and non-face-to-face time personally spent by the physician or QHP and other physicians or QHPs in the same group and same subspecialty that is reporting the single inpatient/observation consultation are summed to select the appropriate code. Please consider all the time spent on the service for a full calendar day.

"Unit/floor time" is no longer the basis of time when selecting a code level based upon time. It is total time on the date of the encounter, whether on or off the unit /floor.

Hospital Inpatient/Observation Consultation Services

Services PRIOR to work on the unit/floor ON THE DATE OF THE ENCOUNTER:

This includes services that are not performed on the patient's hospital unit or floor, including: communications with other professionals and the patient's family; obtaining and/or reviewing the results of diagnostic and other studies; and written and telephone reports.

Services ON the unit/floor ON THE DATE OF THE ENCOUNTER:

This includes the services provided while you are present on the patient's hospital unit or floor, including: reviewing the patient's chart; seeing the patient, writing orders or performing documentation, and communicating with other professionals and the patient's family.

Services AFTER work on the unit/floor ON THE DATE OF THE ENCOUNTER:

This includes services that are not provided on the patient's hospital unit or floor, including: communicating further with other professionals and the patient's family; obtaining and/or reviewing the results of diagnostic and other studies; writing orders or performing documentation and other written or telephone reports.

3. Question 2 was expanded to include Question 2A to be used as a "worksheet" for considering time based on the definitions of time. This was followed by Question 2B which automatically populated the total time based on Question 2A, requesting that the survey respondent confirm the total time was accurate (or go back and adjust times in Question 2A. Question 2B was meant to establish a total time for the revised codes as arrayed, with confirmation by the respondent prior to proceeding with the survey.

   The statistics for Question 2A are shown below—for information. There is not a way to calculate the median based on medians of subsets of the whole and still be statistically accurate. It is statistically incorrect to sum the median statistic of individual components for the same day of service and call that sum the median of total time. This is because each respondent "arranged" their day of service time based on their particular experience. In Question 2B the respondents were asked to focus on total time and confirm that total time was accurate. The goal of the survey time question was to collect total time. As comparison, it is also incorrect to sum the minimum or maximum statistic and state the sum is the minimum or maximum of total time. For example, considering code 99253, no respondent indicated 7 minutes for total time; the minimum total time for any respondent was 15 minutes.

Question 2A Data

TIME	Before Floor 99252	On Floor 99252	After Floor 99252	Before Floor 99253	On Floor 99253	After Floor 99253	Before Floor 99254	On Floor 99254	After Floor 99254	Before Floor 99255	On Floor 99255	After Floor 99255
Min	0	3	0	2	5	0	4	5	0	5	5	0

Question 2 text revisions are highlighted in red

Question 2A

How much physician/QHP time on the date of encounter is required per patient treated for each of the following steps in patient care related to the survey code(s)? It is important to be as precise as possible. For example, indicate 3 or 6 minutes instead of rounding to 5 minutes or indicate 14 or 17 minutes instead of rounding to 15 minutes. Type in your answers (in minutes) in each box below. If no time is typically spent on a listed time period, please enter 0 minutes. It is important that you list all the time on a calendar date and, if more than one physician/QHP is performing the single service, to sum the time spent on the date.

Please refer to the definitions of physician time above.

~~IMPORTANT: Beginning in 2023, when total time on the date of encounter is used to select the appropriate level of a Inpatient or Observation Consultation Service code, both the face-to-face and non-face-to-face time personally spent by the physician and/or QHP are summed to select the appropriate code.~~

DO NOT include the time provided by clinical staff, such as RNs, LPNs, MAs and technicians, as their time is measured separately from this survey and do not include time for services that are separately reported.

	Place your time (in minutes) below
✶ Physician/QHP time on date of encounter PRIOR to work on the unit/floor (in minutes)	
Physician/QHP time on date of encounter ON the unit/floor (in minutes)	
Physician/QHP time on Date of Encounter AFTER work on the unit/floor (in minutes)	

Question 2B

Below is the TOTAL physician/QHP time you estimated that is typically performed on the date of encounter (this is the aggregate of your responses for each code in the previous question). “Unit/floor time” is no longer the basis of time when selecting a code level based upon time. It is total time on the date of the encounter, whether on or off the unit/floor. Also, these estimated times should not include time for services that are separately reported and also should NOT include the time provided by clinical staff, such as RNs, LPNs, MAs and technicians, as their time is measured separately from this survey.

CPT Code	Descriptor	TOTAL Physician/QHP time on Date of Encounter from Your Estimate
<auto populate>	<auto populate>	<auto populate>

Please confirm that the above Total Time estimates, which aggregated your responses to the previous survey question, represent the total physician/QHP time on the date of encounter that is required per patient treated for each of the following steps in patient care related to the survey code(s). If you wish to adjust any of your time estimates after reviewing the Total Time, click the BACK button below, and update your estimates as needed.

- ○ I confirm that I have reviewed the above Total Time estimates and they appropriately reflect the total physician/QHP time on the date of encounter.

SUMMARY OF RECOMMENDATION

CPT Code:99252 Tracking Number G5 Original Specialty Recommended RVU: **1.50**
Presented Recommended RVU: **1.50**
Global Period: XXX Current Work RVU: **1.50** RUC Recommended RVU: **1.50**

CPT Descriptor: Inpatient or observation consultation for a new or established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A requested inpatient consultation, which includes review of the relevant data and a medically appropriate history and/or examination, is performed. The problem is determined to be self-limited. A report is generated and sent to the requesting provider.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Review the referring physician/QHP request for the consultant's expert opinion for management of a specific medical problem. Review available prior medical records, including labs and imaging. Order and review additional records, diagnostic labs, imaging and/or other tests as necessary for the consultation. Incorporate pertinent information into the medical record. Coordinate with other members of the health care team. Visit patient location (e.g., floor, observation area, unit), confirm patient's identity. Review the medical history with the patient and/or family/caregiver. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis requiring straightforward medical decision making [MDM]. Discuss the findings with the patient and family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Document the encounter in the medical record. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Generate and a report that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient to the requesting provider. Document the report in the medical record. Communicate with other members of the health care team regarding the consultation. Respond to follow-up questions from the requesting physician/QHP and patient/family.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99202	XXX	0.93	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99203	XXX	1.60	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
78072	XXX	1.60	**RUC Time**	12,267

CPT Descriptor 1 Parathyroid planar imaging (including subtraction, when performed); with tomographic (SPECT), and concurrently acquired computed tomography (CT) for anatomical localization

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
92014	XXX	1.42	**RUC Time**	12,589,511

CPT Descriptor 2 Ophthalmological services: medical examination and evaluation, with initiation or continuation of diagnostic and treatment program; comprehensive, established patient, 1 or more visits

Other Reference CPT Code	Global	Work RVU	Time Source
99392	XXX	1.50	**RUC Time**

CPT Descriptor Periodic comprehensive preventive medicine reevaluation and management of an individual including an age and gender appropriate history, examination, counseling/anticipatory guidance/risk factor reduction interventions, and the ordering of laboratory/diagnostic procedures, established patient; early childhood (age 1 through 4 years)

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 73 **% of respondents:** 35.4 **%**

Number of respondents who choose 2nd Key Reference Code: 39 **% of respondents:** 18.9 **%**

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	5%	6%	58%	34%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed	5%	59%	36%

and analyzed • Urgency of medical decision making	

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	7%	79%	14%
Physical effort required	4%	68%	28%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	8%	55%	37%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	13%	41%	46%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	10%	46%	44%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	64%	28%
Physical effort required	5%	64%	31%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	56%	39%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 2023 Changes

At the February 4-5, 2021 CPT virtual meeting, the following changes to the inpatient consultation codes were approved:

- Deletion of code 99251
- Revision of codes 99252-99255 to align with changes to office/outpatient visit codes (99202-99215) including:
    - Performing a medically appropriate history and/or examination
    - Allowing selection of level of service based on total time or medical decision making
- Recommendation to backfill code-level minimum time based on a RUC survey

Survey Process
AMA staff and the co-chairs of the CPT/RUC E/M Workgroup drafted a survey for the inpatient consultation codes that was based on the 2019 office visit survey. This survey template was approved by the Research Subcommittee during a conference call on February 23, 2021. On this same call, the Research Subcommittee reviewed a list of potential reference codes to assist the surveying specialties with development of the inpatient consultation survey RSL. On May 24, 2021, the Research Subcommittee reviewed and approved a request to modify the inpatient consultation vignettes that were drafted by the CPT/RUC E/M Workgroup for the CPT code change application. Twenty-three societies surveyed the inpatient consultation codes. Over 250 responses for physician work were received for each code.

Concerns, however, arose at the October 2021 RUC meeting about the accuracy of the times provided by respondents because of the survey tool utilized. The societies believed that some respondents may have only been considering floor/unit time and not the time before or after floor/unit time on the date of encounter. The RUC agreed with the specialty societies to resurvey the inpatient and observation consultation services, after revision of the survey tool to include definitions of time before and after floor/unit time. This would allow better comparison to prior surveys that included these time components. It should be noted that although the revised survey tool included a worksheet question asking for separate on/off floor times on the date of service, this question was followed by a question that included the summed total time for respondent confirmation that the total time was accurate. If the respondent did not agree with the total time for one or more of the four codes as arrayed, then the respondent was asked to return to the worksheet question and adjust the times as needed. The respondent could not move forward in the survey before affirming that the total times on the date of encounter were accurate. Both survey tools are included in the RUC materials.

Discussion of Increased Intensity

Change in Technology
Although the recommended work RVUs for codes 99252-99255 are not greater than the current values, it is important to point out that the compelling evidence that supported the increased work RVUs for the office visit codes (99202-99215) also provides support for an increase in intensity of work for the inpatient consultation codes, specifically, a change in technology. The establishment of EHRs since these codes were last reviewed has dramatically changed care, allowing for more information requiring review and analysis. Patients present at a hospital with acute problems or exacerbation of current problems. Assessment of the problem needs to be performed expeditiously. The increased knowledge base in EHRs has increased intensity and complexity of patient care by requiring review and analysis of more data in the same or shorter amount of time. We believe the intensity of this work is greater than the intensity of work when compared with office visits – or at a minimum not less intense.

Accuracy of RUC Database Times
Setting aside the concerns about the survey tool used for the October survey, we are concerned with the accuracy of the existing times. The current times are based on a 2006 survey of 600 individuals with only 45 responses from five specialties (ASH, IDSA, AAN, AOA, and ACP). The dominant specialty (cardiology) did not participate in the survey,

and no surgical specialties participated, reflective of a flawed survey methodology. It is reasonable to conclude that changes in technology, changes in practice patterns, and changes in surveying specialties for the current survey have resulted in times and intensities that are more accurate when compared to surveys from 15 years ago.

Survey Analysis

Survey Time
Due to the CPT changes, all time reported for an inpatient/observation consultation is considered to be on the date of that service and is considered to be intra-service time for purposes of time included in the RUC database and time to be included in the CPT code descriptor. Stated another way, for E/M services, intra-time is the date of encounter time and RUC database pre-and post-time (if applicable) is time spent on day(s) before or day(s) after the date of encounter. Therefore, the intra-service time for the consult services is equal to the total time on the date of encounter, since no time is allowed for day(s) before or after for this set of codes.

Key References
The key reference services chosen by respondents were all office visit codes that had been revalued effective 2021. This is important because the work RVU of the office visit codes are reflective of time collected for a ten-day period. However, the office visit code descriptors only include a range of time for the day of the encounter (e.g., for 99213 the range is 20-29 minutes). To be clear, the office visit code descriptor time is day of service, but there is additional time that survey respondents are not aware of for three days before the date of the visit to seven days after the date of the visit. This has confused the survey process and the comparison between office visit codes and other E/M codes because the survey respondent only knows about the time in the code descriptor and not the additional times that are in the RUC database. In addition, the office visit code descriptor times, which are a range of times, were established by the CPT Panel **prior** to the survey of the office visit codes, which is different than how all the other E/M surveys were conducted (i.e., without time included in the descriptors).

This means that the survey intra-service time for the inpatient consultations is NOT comparable to the sum of the pre, intra, and post-service times of the office visit codes that were chosen as reference services. This is a key point because comparing the survey times to the total time of the reference services (i.e., the sum of the pre, intra, and post-service times of the office visit codes) is NOT appropriate and should not be made. Again, the respondents only saw the CPT descriptor with a time range for the office codes that were picked as reference services. Those descriptors include the CPT Panel assigned typical time range and not survey times (ie, there is a disconnect between the code descriptor time and the survey time components).

This means the most relevant comparison should primarily be magnitude estimation based on MDM, followed by a comparison with the intra-service time of the office visits. The expert panel concluded that the pre- and post-service time of the office visit reference services should be ignored in any analysis of magnitude estimation for work. For example, if a key reference service has a survey intra-service time of 30 minutes, a code descriptor that says the typical time is “30-39 minutes” and the inpatient code being surveyed has an intra/total time of 35 minutes, the time of the inpatient survey code is within the range of the time for the reference service.

The expert panel concluded that this was the only way the survey data could be appropriately compared to the key reference services (i.e., so there would be a true apples-to-apples comparison) and to account for the fact that the reference services are based on work performed over ten days even though the code descriptors and CPT guidelines do not indicate that fact.

The expert panel also agreed that as a general matter, the inpatient consultation codes require more work than the equivalent non-consultation inpatient codes to account for the additional expert opinion report.

Panel Recommendations

99252

The expert panel reviewed the intensity/complexity measures. Most respondents reported that the overall intensity and complexity of 99252 was identical or more intense/complex than office visit services. Very few of the respondents reported that 99252 was less intense/complex than the reference services. This is important because most of the

respondents are familiar with both office and facility E/M services and therefore, there is good fitness to rate and compare intensity/complexity and work.

The key reference services were 99202 (time range 15-29) and 99203 (time range 30-44) The expert panel noted that the time of 35 minutes is squarely within the time range for 99203 (30-44 minutes) and that 99202 and 99252 both have straightforward level MDM. However, the intraservice time spent on the date of service for 99252 is 75% more than the total service time of 20 minutes for 99202. When compared to second key reference service 99203, surveyed code 99252 has identical total time and a slightly lower median work RVU. This comparison also makes sense, as a Level 2 inpatient consult is reasonably estimated to be more work than a Level 2 new patient office visit and similar or slightly less than a Level 3 new patient office visit.

Therefore, the expert panel recommends the survey total time of 35 minutes and the survey median RVU of 1.50.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99251/99252

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty General Surgery How often? Commonly

Specialty Internal Medicine How often? Commonly

Specialty Podiatry How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. National utilization not available

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99253 Tracking Number G6 Original Specialty Recommended RVU: **2.00**
Presented Recommended RVU: **2.00**
Global Period: XXX Current Work RVU: **2.27** RUC Recommended RVU: **2.00**

CPT Descriptor: Inpatient or observation consultation for a new or established patient, which requires a medically appropriate history and/or examination and low level of medical decision making

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A requested inpatient consultation, which includes review of the relevant data and a medically appropriate history and/or examination, is performed. The problem is determined to be an acute uncomplicated illness or injury. A report is generated and sent to the requesting provider.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Review the referring physician/QHP request for the consultant's expert opinion for management of a specific medical problem. Review available prior medical records, including labs and imaging. Order and review additional records, diagnostic labs, imaging and/or other tests as necessary for the consultation. Incorporate pertinent information into the medical record. Coordinate with other members of the health care team. Visit patient location (e.g., floor, observation area, unit), confirm patient's identity. Review the medical history with the patient and/or family/caregiver. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis requiring low level medical decision making [MDM]. Discuss the findings with the patient and family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Document the encounter in the medical record. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Generate and a report that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient to the requesting provider. Document the report in the medical record. Communicate with other members of the health care team regarding the consultation. Respond to follow-up questions from the requesting physician/QHP and patient/family.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	4%	36%	56%	4%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	1%	53%	46%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	78%	17%
Physical effort required	3%	58%	39%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	6%	42%	52%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	3%	58%	39%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	5%	61%	34%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	84%	11%
Physical effort required	8%	79%	13%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	11%	53%	36%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 2023 Changes

At the February 4-5, 2021 CPT virtual meeting, the following changes to the inpatient consultation codes were approved:

- Deletion of code 99251
- Revision of codes 99252-99255 to align with changes to office/outpatient visit codes (99202-99215) including:
  - Performing a medically appropriate history and/or examination
  - Allowing selection of level of service based on total time or medical decision making
- Recommendation to backfill code-level minimum time based on a RUC survey

Survey Process

AMA staff and the co-chairs of the CPT/RUC E/M Workgroup drafted a survey for the inpatient consultation codes that was based on the 2019 office visit survey. This survey template was approved by the Research Subcommittee during a conference call on February 23, 2021. On this same call, the Research Subcommittee reviewed a list of potential reference codes to assist the surveying specialties with development of the inpatient consultation survey RSL. On May 24, 2021, the Research Subcommittee reviewed and approved a request to modify the inpatient consultation vignettes that were drafted by the CPT/RUC E/M Workgroup for the CPT code change application. Twenty-three societies surveyed the inpatient consultation codes. Over 250 responses for physician work were received for each code.

Concerns, however, arose at the October 2021 RUC meeting about the accuracy of the times provided by respondents because of the survey tool utilized. The societies believed that some respondents may have only been considering floor/unit time and not the time before or after floor/unit time on the date of encounter. The RUC agreed with the specialty societies to resurvey the inpatient and observation consultation services, after revision of the survey tool to include definitions of time before and after floor/unit time. This would allow better comparison to prior surveys that included these time components. It should be noted that although the revised survey tool included a worksheet question asking for separate on/off floor times on the date of service, this question was followed by a question that included the summed total time for respondent confirmation that the total time was accurate. If the respondent did not agree with the total time for one or more of the four codes as arrayed, then the respondent was asked to return to the worksheet question and adjust the times as needed. The respondent could not move forward in the survey before affirming that the total times on the date of encounter were accurate. Both survey tools are included in the RUC materials.

Discussion of Increased Intensity

Change in Technology

Although the recommended work RVUs for codes 99252-99255 are not greater than the current values, it is important to point out that the compelling evidence that supported the increased work RVUs for the office visit codes (99202-99215) also provides support for an increase in intensity of work for the inpatient consultation codes, specifically, a change in technology. The establishment of EHRs since these codes were last reviewed has dramatically changed care, allowing for more information requiring review and analysis. Patients present at a hospital with acute problems or exacerbation of current problems. Assessment of the problem needs to be performed expeditiously. The increased knowledge base in EHRs has increased intensity and complexity of patient care by requiring review and analysis of more data in the same or shorter amount of time. We believe the intensity of this work is greater than the intensity of work when compared with office visits – or at a minimum not less intense.

Accuracy of RUC Database Times

Setting aside the concerns about the survey tool used for the October survey, we are concerned with the accuracy of the existing times. The current times are based on a 2006 survey of 600 individuals with only 45 responses from five specialties (ASH, IDSA, AAN, AOA, and ACP). The dominant specialty (cardiology) did not participate in the survey, and no surgical specialties participated, reflective of a flawed survey methodology. It is reasonable to conclude that changes in technology, changes in practice patterns, and changes in surveying specialties for the current survey have resulted in times and intensities that are more accurate when compared to surveys from 15 years ago.

Survey Analysis

Survey Time

Due to the CPT changes, all time reported for an inpatient/observation consultation is considered to be on the date of that service and is considered to be intra-service time for purposes of time included in the RUC database and time to be included in the CPT code descriptor. Stated another way, for E/M services, intra-time is the date of encounter time and RUC database pre-and post-time (if applicable) is time spent on day(s) before or day(s) after the date of encounter. Therefore, the intra-service time for the consult services is equal to the total time on the date of encounter, since no time is allowed for day(s) before or after for this set of codes.

Key References

The key reference services chosen by respondents were all office visit codes that had been revalued effective 2021. This is important because the work RVU of the office visit codes are reflective of time collected for a ten-day period. However, the office visit code descriptors only include a range of time for the day of the encounter (e.g., for 99213 the range is 20-29 minutes). To be clear, the office visit code descriptor time is day of service, but there is additional time that survey respondents are not aware of for three days before the date of the visit to seven days after the date of the visit. This has confused the survey process and the comparison between office visit codes and other E/M codes because the survey respondent only knows about the time in the code descriptor and not the additional times that are in the RUC database. In addition, the office visit code descriptor times, which are a range of times, were established by the CPT Panel **prior** to the survey of the office visit codes, which is different than how all the other E/M surveys were conducted (i.e., without time included in the descriptors).

This means that the survey intra-service time for the inpatient consultations is NOT comparable to the sum of the pre, intra, and post-service times of the office visit codes that were chosen as reference services. This is a key point because comparing the survey times to the total time of the reference services (i.e., the sum of the pre, intra, and post-service times of the office visit codes) is NOT appropriate and should not be made. Again, the respondents only saw the CPT descriptor with a time range for the office codes that were picked as reference services. Those descriptors include the CPT Panel assigned typical time range and not survey times (ie, there is a disconnect between the code descriptor time and the survey time components).

This means the most relevant comparison should primarily be magnitude estimation based on MDM, followed by a comparison with the intra-service time of the office visits. The expert panel concluded that the pre- and post-service time of the office visit reference services should be ignored in any analysis of magnitude estimation for work. For example, if a key reference service has a survey intra-service time of 30 minutes, a code descriptor that says the typical time is “30-39 minutes” and the inpatient code being surveyed has an intra/total time of 35 minutes, the time of the inpatient survey code is within the range of the time for the reference service.

The expert panel concluded that this was the only way the survey data could be appropriately compared to the key reference services (i.e., so there would be a true apples-to-apples comparison) and to account for the fact that the reference services are based on work performed over ten days even though the code descriptors and CPT guidelines do not indicate that fact.

The expert panel also agreed that as a general matter, the inpatient consultation codes require more work than the equivalent non-consultation inpatient codes to account for the additional expert opinion report.

Panel Recommendations

99253

The expert panel reviewed the intensity/complexity measures. Well over 50% of respondents reported that the overall intensity and complexity of these services was somewhat, or much more than the office visit services. Virtually none of the respondents reported that the services were less intense/complex than the reference services. This confirmed the expert panel’s understanding that inpatient visits are more intense the outpatient office visits. This is important because most of the respondents are familiar with both office and facility E/M services and therefore, there is good fitness to rate and compare intensity/complexity and work.

The key reference services were 99203 (time range 30-44) and 99213 (time range 20-29). The expert panel noted that the time of 45 minutes for 99253 is just beyond the time range for 99203 (30-44 minutes) and that 99203 and 99253 both have low-level MDM. The intraservice time spent on the date of service for 99253 is longer than that of 99203. This comparison makes sense, as a Level 3 inpatient consult is reasonably estimated to be more work than a Level 3 new patient office visit and above a Level 3 existing patient office visit.

Therefore, the expert panel recommends the survey intra/total time of 45 minutes and the survey median RVU of 2.00.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99253

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Commonly

Specialty Gastroenterology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare currently does not pay for inpatient visit consult codes. If CMS agrees to revise its policy, the last page of this SOR includes the 2009 utilization and specialty distribution for code 99253 for informational purposes.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage %

Do many physicians perform this service across the United States? Yes

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Review the referring physician/QHP request for the consultant's expert opinion for management of a specific medical problem. Review available prior medical records, including labs and imaging. Order and review additional records, diagnostic labs, imaging and/or other tests as necessary for the consultation. Incorporate pertinent information into the medical record. Coordinate with other members of the health care team. Visit patient location (e.g., floor, observation area, unit), confirm patient's identity. Review the medical history with the patient and/or family/caregiver. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis requiring moderate level medical decision making [MDM]. Discuss the findings with the patient and family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Document the encounter in the medical record. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Generate and a report that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient to the requesting provider. Document the report in the medical record. Communicate with other members of the health care team regarding the consultation. Respond to follow-up questions from the requesting physician/QHP and patient/family.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99204	XXX	2.60	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99205	XXX	3.50	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99215	XXX	2.80	**RUC Time**	10,388,878

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99205	XXX	3.50	**RUC Time**	2,923,626

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	22%	57%	21%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	29%	71%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	69%	31%
Physical effort required	1%	45%	54%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	1%	27%	72%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	4%	31%	50%	15%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	6%	36%	58%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	56%	38%
Physical effort required	2%	46%	52%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	6%	25%	69%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 2023 Changes

At the February 4-5, 2021 CPT virtual meeting, the following changes to the inpatient consultation codes were approved:

- Deletion of code 99251
- Revision of codes 99252-99255 to align with changes to office/outpatient visit codes (99202-99215) including:
  - Performing a medically appropriate history and/or examination
  - Allowing selection of level of service based on total time or medical decision making
- Recommendation to backfill code-level minimum time based on a RUC survey

Survey Process

AMA staff and the co-chairs of the CPT/RUC E/M Workgroup drafted a survey for the inpatient consultation codes that was based on the 2019 office visit survey. This survey template was approved by the Research Subcommittee during a conference call on February 23, 2021. On this same call, the Research Subcommittee reviewed a list of potential reference codes to assist the surveying specialties with development of the inpatient consultation survey RSL. On May 24, 2021, the Research Subcommittee reviewed and approved a request to modify the inpatient consultation vignettes that were drafted by the CPT/RUC E/M Workgroup for the CPT code change application. Twenty-three societies surveyed the inpatient consultation codes. Over 250 responses for physician work were received for each code.

Concerns, however, arose at the October 2021 RUC meeting about the accuracy of the times provided by respondents because of the survey tool utilized. The societies believed that some respondents may have only been considering floor/unit time and not the time before or after floor/unit time on the date of encounter. The RUC agreed with the specialty societies to resurvey the inpatient and observation consultation services, after revision of the survey tool to include definitions of time before and after floor/unit time. This would allow better comparison to prior surveys that included these time components. It should be noted that although the revised survey tool included a worksheet question asking for separate on/off floor times on the date of service, this question was followed by a question that included the summed total time for respondent confirmation that the total time was accurate. If the respondent did not agree with the total time for one or more of the four codes as arrayed, then the respondent was asked to return to the worksheet question and adjust the times as needed. The respondent could not move forward in the survey before affirming that the total times on the date of encounter were accurate. Both survey tools are included in the RUC materials.

Discussion of Increased Intensity

Change in Technology

Although the recommended work RVUs for codes 99252-99255 are not greater than the current values, it is important to point out that the compelling evidence that supported the increased work RVUs for the office visit codes (99202-99215) also provides support for an increase in intensity of work for the inpatient consultation codes, specifically, a change in technology. The establishment of EHRs since these codes were last reviewed has dramatically changed care, allowing for more information requiring review and analysis. Patients present at a hospital with acute problems or exacerbation of current problems. Assessment of the problem needs to be performed expeditiously. The increased knowledge base in EHRs has increased intensity and complexity of patient care by requiring review and analysis of more data in the same or shorter amount of time. We believe the intensity of this work is greater than the intensity of work when compared with office visits – or at a minimum not less intense.

Accuracy of RUC Database Times

Setting aside the concerns about the survey tool used for the October survey, we are concerned with the accuracy of the existing times. The current times are based on a 2006 survey of 600 individuals with only 45 responses from five specialties (ASH, IDSA, AAN, AOA, and ACP). The dominant specialty (cardiology) did not participate in the survey, and no surgical specialties participated, reflective of a flawed survey methodology. It is reasonable to conclude that changes in technology, changes in practice patterns, and changes in surveying specialties for the current survey have resulted in times and intensities that are more accurate when compared to surveys from 15 years ago.

Survey Analysis

Survey Time

Due to the CPT changes, all time reported for an inpatient/observation consultation is considered to be on the date of that service and is considered to be intra-service time for purposes of time included in the RUC database and time to be

included in the CPT code descriptor. Stated another way, for E/M services, intra-time is the date of encounter time and RUC database pre-and post-time (if applicable) is time spent on day(s) before or day(s) after the date of encounter. Therefore, the intra-service time for the consult services is equal to the total time on the date of encounter, since no time is allowed for day(s) before or after for this set of codes.

Key References
The key reference services chosen by respondents were all office visit codes that had been revalued effective 2021. This is important because the work RVU of the office visit codes are reflective of time collected for a ten-day period. However, the office visit code descriptors only include a range of time for the day of the encounter (e.g., for 99213 the range is 20-29 minutes). To be clear, the office visit code descriptor time is day of service, but there is additional time that survey respondents are not aware of for three days before the date of the visit to seven days after the date of the visit. This has confused the survey process and the comparison between office visit codes and other E/M codes because the survey respondent only knows about the time in the code descriptor and not the additional times that are in the RUC database. In addition, the office visit code descriptor times, which are a range of times, were established by the CPT Panel **prior** to the survey of the office visit codes, which is different than how all the other E/M surveys were conducted (i.e., without time included in the descriptors).

This means that the survey intra-service time for the inpatient consultations is NOT comparable to the sum of the pre, intra, and post-service times of the office visit codes that were chosen as reference services. This is a key point because comparing the survey times to the total time of the reference services (i.e., the sum of the pre, intra, and post-service times of the office visit codes) is NOT appropriate and should not be made. Again, the respondents only saw the CPT descriptor with a time range for the office codes that were picked as reference services. Those descriptors include the CPT Panel assigned typical time range and not survey times (ie, there is a disconnect between the code descriptor time and the survey time components).

This means the most relevant comparison should primarily be magnitude estimation based on MDM, followed by a comparison with the intra-service time of the office visits. The expert panel concluded that the pre- and post-service time of the office visit reference services should be ignored in any analysis of magnitude estimation for work. For example, if a key reference service has a survey intra-service time of 30 minutes, a code descriptor that says the typical time is "30-39 minutes" and the inpatient code being surveyed has an intra/total time of 35 minutes, the time of the inpatient survey code is within the range of the time for the reference service.

The expert panel concluded that this was the only way the survey data could be appropriately compared to the key reference services (i.e., so there would be a true apples-to-apples comparison) and to account for the fact that the reference services are based on work performed over ten days even though the code descriptors and CPT guidelines do not indicate that fact.

The expert panel also agreed that as a general matter, the inpatient consultation codes require more work than the equivalent non-consultation inpatient codes to account for the additional expert opinion report.

Panel Recommendations

99254

The expert panel reviewed the intensity/complexity measures. Well over 50% of respondents reported that the overall intensity and complexity of these services was somewhat, or much more than the office visit services. Virtually none of the respondents reported that the services were less intense/complex than the reference services. This confirmed the expert panel's understanding that inpatient visits are more intense the outpatient office visits. This is important because most of the respondents are familiar with both office and facility E/M services and therefore, there is good fitness to rate and compare intensity/complexity and work.

The key reference services were 99204 (time range 45-59) and 99205 (time range 60-74). The expert panel noted that the time of 60 minutes for 99254 is just beyond the time range for 99204 (45-59 minutes) and that 99204 and 99254 both have moderate-level MDM. The intraservice time spent on the date of service for 99254 is higher than that of 99204. This comparison makes sense, as a Level 4 inpatient consult is reasonably estimated to be more work than a Level 4 new patient office visit and less work than a Level 5 new patient office visit.

Therefore, the expert panel recommends the survey intra/total time of 60 minutes and the survey median RVU of 3.00.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99254

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Commonly

Specialty Gastroenterology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare currently does not pay for inpatient visit consult codes. If CMS agrees to revise its policy, the last page of this SOR includes the 2009 utilization and specialty distribution for code 99254 for informational purposes.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Inpatient or observation consultation for a new or established patient, which requires a medically appropriate history and/or examination and high level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A requested inpatient consultation, which includes review of the relevant data and a medically appropriate history and/or examination, is performed. The problem is determined to be a chronic illness with severe exacerbation, progression or side effects of treatment. A report is generated and sent to the requesting provider.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Review the referring physician/QHP request for the consultant's expert opinion for management of a specific medical problem. Review available prior medical records, including labs and imaging. Order and review additional records, diagnostic labs, imaging and/or other tests as necessary for the consultation. Incorporate pertinent information into the medical record. Coordinate with other members of the health care team. Visit patient location (e.g., floor, observation area, unit), confirm patient's identity. Review the medical history with the patient and/or family/caregiver. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis requiring high level medical decision making [MDM]. Discuss the findings with the patient and family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Document the encounter in the medical record. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Generate and a report that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient to the requesting provider. Document the report in the medical record. Communicate with other members of the health care team regarding the consultation. Respond to follow-up questions from the requesting physician/QHP and patient/family.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	17%	35%	48%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	1%	27%	72%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	1%	57%	42%
Physical effort required	1%	42%	57%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	1%	21%	78%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	15%	38%	15%	32%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	17%	34%	49%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	15%	51%	34%
Physical effort required	15%	34%	51%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	15%	30%	55%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 2023 Changes

At the February 4-5, 2021 CPT virtual meeting, the following changes to the inpatient consultation codes were approved:

- Deletion of code 99251
- Revision of codes 99252-99255 to align with changes to office/outpatient visit codes (99202-99215) including:
  - Performing a medically appropriate history and/or examination
  - Allowing selection of level of service based on total time or medical decision making
- Recommendation to backfill code-level minimum time based on a RUC survey

Survey Process

AMA staff and the co-chairs of the CPT/RUC E/M Workgroup drafted a survey for the inpatient consultation codes that was based on the 2019 office visit survey. This survey template was approved by the Research Subcommittee during a conference call on February 23, 2021. On this same call, the Research Subcommittee reviewed a list of potential reference codes to assist the surveying specialties with development of the inpatient consultation survey RSL. On May 24, 2021, the Research Subcommittee reviewed and approved a request to modify the inpatient consultation vignettes that were drafted by the CPT/RUC E/M Workgroup for the CPT code change application. Twenty-three societies surveyed the inpatient consultation codes. Over 250 responses for physician work were received for each code.

Concerns, however, arose at the October 2021 RUC meeting about the accuracy of the times provided by respondents because of the survey tool utilized. The societies believed that some respondents may have only been considering floor/unit time and not the time before or after floor/unit time on the date of encounter. The RUC agreed with the specialty societies to resurvey the inpatient and observation consultation services, after revision of the survey tool to include definitions of time before and after floor/unit time. This would allow better comparison to prior surveys that included these time components. It should be noted that although the revised survey tool included a worksheet question asking for separate on/off floor times on the date of service, this question was followed by a question that included the summed total time for respondent confirmation that the total time was accurate. If the respondent did not agree with the total time for one or more of the four codes as arrayed, then the respondent was asked to return to the worksheet question and adjust the times as needed. The respondent could not move forward in the survey before affirming that the total times on the date of encounter were accurate. Both survey tools are included in the RUC materials.

Discussion of Increased Intensity

Change in Technology

Although the recommended work RVUs for codes 99252-99255 are not greater than the current values, it is important to point out that the compelling evidence that supported the increased work RVUs for the office visit codes (99202-99215) also provides support for an increase in intensity of work for the inpatient consultation codes, specifically, a change in technology. The establishment of EHRs since these codes were last reviewed has dramatically changed care, allowing for more information requiring review and analysis. Patients present at a hospital with acute problems or exacerbation of current problems. Assessment of the problem needs to be performed expeditiously. The increased knowledge base in EHRs has increased intensity and complexity of patient care by requiring review and analysis of more data in the same or shorter amount of time. We believe the intensity of this work is greater than the intensity of work when compared with office visits – or at a minimum not less intense.

Accuracy of RUC Database Times

Setting aside the concerns about the survey tool used for the October survey, we are concerned with the accuracy of the existing times. The current times are based on a 2006 survey of 600 individuals with only 45 responses from five specialties (ASH, IDSA, AAN, AOA, and ACP). The dominant specialty (cardiology) did not participate in the survey, and no surgical specialties participated, reflective of a flawed survey methodology. It is reasonable to conclude that changes in technology, changes in practice patterns, and changes in surveying specialties for the current survey have resulted in times and intensities that are more accurate when compared to surveys from 15 years ago.

Survey Analysis

Survey Time

Due to the CPT changes, all time reported for an inpatient/observation consultation is considered to be on the date of that service and is considered to be intra-service time for purposes of time included in the RUC database and time to be

included in the CPT code descriptor. Stated another way, for E/M services, intra-time is the date of encounter time and RUC database pre-and post-time (if applicable) is time spent on day(s) before or day(s) after the date of encounter. Therefore, the intra-service time for the consult services is equal to the total time on the date of encounter, since no time is allowed for day(s) before or after for this set of codes.

Key References

The key reference services chosen by respondents were all office visit codes that had been revalued effective 2021. This is important because the work RVU of the office visit codes are reflective of time collected for a ten-day period. However, the office visit code descriptors only include a range of time for the day of the encounter (e.g., for 99213 the range is 20-29 minutes). To be clear, the office visit code descriptor time is day of service, but there is additional time that survey respondents are not aware of for three days before the date of the visit to seven days after the date of the visit. This has confused the survey process and the comparison between office visit codes and other E/M codes because the survey respondent only knows about the time in the code descriptor and not the additional times that are in the RUC database. In addition, the office visit code descriptor times, which are a range of times, were established by the CPT Panel **prior** to the survey of the office visit codes, which is different than how all the other E/M surveys were conducted (i.e., without time included in the descriptors).

This means that the survey intra-service time for the inpatient consultations is NOT comparable to the sum of the pre, intra, and post-service times of the office visit codes that were chosen as reference services. This is a key point because comparing the survey times to the total time of the reference services (i.e., the sum of the pre, intra, and post-service times of the office visit codes) is NOT appropriate and should not be made. Again, the respondents only saw the CPT descriptor with a time range for the office codes that were picked as reference services. Those descriptors include the CPT Panel assigned typical time range and not survey times (ie, there is a disconnect between the code descriptor time and the survey time components).

This means the most relevant comparison should primarily be magnitude estimation based on MDM, followed by a comparison with the intra-service time of the office visits. The expert panel concluded that the pre- and post-service time of the office visit reference services should be ignored in any analysis of magnitude estimation for work. For example, if a key reference service has a survey intra-service time of 30 minutes, a code descriptor that says the typical time is "30-39 minutes" and the inpatient code being surveyed has an intra/total time of 35 minutes, the time of the inpatient survey code is within the range of the time for the reference service.

The expert panel concluded that this was the only way the survey data could be appropriately compared to the key reference services (i.e., so there would be a true apples-to-apples comparison) and to account for the fact that the reference services are based on work performed over ten days even though the code descriptors and CPT guidelines do not indicate that fact.

The expert panel also agreed that as a general matter, the inpatient consultation codes require more work than the equivalent non-consultation inpatient codes to account for the additional expert opinion report.

Panel Recommendations

99255

The expert panel reviewed the intensity/complexity measures. Well over 50% of respondents reported that the overall intensity and complexity of these services was somewhat, or much more than the office visit services. Virtually none of the respondents reported that the services were less intense/complex than the reference services. This confirmed the expert panel's understanding that inpatient visits are more intense the outpatient office visits. This is important because most of the respondents are familiar with both office and facility E/M services and therefore, there is good fitness to rate and compare intensity/complexity and work.

The key reference services were 99205 (time range 60-74) and 99291, the first hour of critical care. The expert panel noted that the time of 80 minutes for 99255 is beyond the time range for 99205 and that 99205 and 99255 both have high-level MDM. The intraservice time spent on the date of service for 99255 is longer than the intraservice time of 99205. This comparison makes sense, as a Level 5 inpatient consult is reasonably estimated to be more intense and more work than a Level 5 new patient office visit and less work than an hour of critical care.

Therefore, the expert panel recommends the survey intra/total time of 80 minutes and the survey median RVU of 4.00.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99255

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Commonly

Specialty Pulmonology How often? Commonly

Specialty Internal Medicine How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization not available

Scott Manaker, MD
AMA/RVS Update PE Subcommittee
American Medical Association
330 N. Wabash Avenue
Chicago, IL 60611

Re: Tab 14 Inpatient/Observation Consultations

Dear Dr. Manaker:

Tab 14 on the January 2022 RUC agenda addresses four revised codes for inpatient/observation consultations. Each of these services will be provided exclusively in the facility setting with no direct practice expense attributable to the clinician billing the service. As such, the multispecialty advisory committee for Tab 14 recommends no direct practice expense inputs.

Thank you for your consideration of this information as you prepare for the upcoming meeting. Please contact James Vavricek at jvavricek@acc.org if you have any questions.

Sincerely,

AAHPM, AAN, AANS, AAOS, AAP, AATS, ACC, ACG, ACNM, ACOG, ACS, AGA, ASCO, ASCRS (colon), ASGE, ASSH, ATS, CHEST, CNS, NASS, SAGES, SNMMI, STS, SVS

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Screen: CMS Request – Final Rule for 2020*

January 2022

Prolonged Services – on the Date of an E/M – Tab 15

In February 2021, the CPT Editorial Panel created prolonged inpatient service add-on code 993X0 to report prolonged face-to-face and non-face-to-face total time provided by the physician or other qualified health care professional (QHP) on the date of an inpatient service (ie, 99223, 99233, 99236, 99255, 99306, 99310). The Panel also revised CPT code 99417, so it would also be used to report prolonged office consultations, home and domiciliary visits and cognitive assessment and care plan services (in conjunction with 99245, 99345, 99350, 99483) in addition to prolonged office and other outpatient visits (with conjunction with codes 99205 and 99215). Codes 99417 and 993X0 are only to be reported when the primary service has been selected using time alone as the basis for code level selection and only after the time required to report the highest-level service has been exceeded by 15 minutes. The Panel also deleted the *Prolonged Service with Direct Patient Contact (Except with Office or Other Outpatient Services)* subsection including codes 99354-99357.

In October 2021, the specialty societies surveyed the two prolonged service on the date of an E/M codes (99417, 993X0) but did not obtain the required number of survey responses for code 993X0. The specialty noted, and the RUC concurred, that the January 2022 meeting is still within the current cycle and would not delay recommendations pertinent to the 2023 Medicare Physician Payment Schedule.

Compelling Evidence for 993X0
The specialty societies presented three points for compelling evidence that the work of providing inpatient hospital and observation care visits for the evaluation and management of patients may have changed, including for prolonged inpatient add-on code 993X0, which is part of the same code family. First, a change in the patient population, the distillation down to sicker patients who are in the hospital for a shorter period; second, a change in technology due to the widespread implementation of institutional electronic health records (EHR), which are data intensive and therefore more intense for the patient encounters; and third, a change in the providers of these services with the recent emergence of hospitalists and intensivists.

Change in Patient Population
The number of diagnoses that appear in the Medicare claims for inpatient visits (based on the 5% Medicare claims file) has increased in the last 16 years since these codes were last reviewed. The largest changes are occurring at the higher-level services. Since 2006, the number of diagnoses has increased by more than 30% for all the codes except 99221 and 99222 which have gone up 25%. For example, for 99223 the number has increased by 31% and for 99233, the increase is 41%. Physicians are experiencing more complicated patients, with more clinical indications to review and consider, while balancing moving these more complicated patients to the next setting of care, such as a skilled nursing facility.

Data from the Chronic Conditions Data Warehouse also support the assertion that Medicare patients have increasing rates of comorbidities that in turn increase the complexity of hospitalizations. In addition to high prevalence of diabetes, hypertension, and COPD among Medicare

beneficiaries, there has been marked increase between 2010 and 2019 in rates of chronic kidney disease (15% to 26%), depression (14% to 19%), and rheumatoid arthritis/osteoarthritis (29% to 35%).

Change in Technology

EHRs have significantly changed since 2006. Some of the most obvious differences are requirements for pharmacy potential interactions to be overridden by the physician, as necessary. Additionally, flags in the EHR are frequent, as they are put in place for safety reasons. However, these flags require the physician/QHP rather than clinical staff to review and override any modifications to treatment, such as a medication change, before the clinical staff can continue with care of the patient. The American Hospital Association reported that in 2017[1] 95% of hospitals had some form of EHR implemented. As reported in 2006 by the Healthcare Financial Management Association, only 13% of hospitals had an EHR for health outcomes; 13% for clinical decision support; and 2% for patient access.

Change in Provider

Hospitalists are a new and growing specialty that was not fully organized as a specialty in 2006 when the codes were last surveyed. The term "hospitalist" was coined in 1996 to describe a trend of primary care physicians choosing to practice exclusively in the hospital[2] and the field began to organize in earnest in the early 2000s. Hospitalists are predominantly internal medicine trained, but there are also a significant number of hospitalists with the specialties of family medicine, pediatrics, and medical subspecialties. In 2011, there were 25,787 adult hospitalists identified using a 90% threshold of Medicare billing claims associated with hospitalizations.[3] In 2012, there were 28,473 hospitalists identified using a nearly identical 90% threshold.[4] New analyses using the same data and methodology suggest the field has continued to grow at a similar rate through 2019, with approximately 44,000 hospitalists identified.[5] As the field grows, the model and systems of care associated with hospitalists continues to spread. In 2006, the impact of hospitalists on the care of hospitalized patients would not have been as pronounced as it is today.

Hospitalist practice diverges from the typical model of inpatient primary care (e.g., rounding in the hospital on their patients) in several important ways. First, hospitalists provide 24-hour coverage of patients in the hospital using a shift-based model. Shifts are typically 12 (~64% of groups) or 10 (~20% of groups) hours long.[6] Shift-based coverage makes at least one handoff between physicians during a 24-hour period, a ubiquitous practice. About 50% of hospitalist groups use a daytime admitter model or a hybrid for admissions,[7] meaning patients who enter the hospital overnight are admitted by one clinician and then dedicated staff the following morning continue the care. These handoffs make assessments of time spent with the patient on a calendar day difficult but reflect the reality of team-based care in many hospitals.

[3] Welch WP, Stearns SC, Cuellar AE, Bindman AB. Use of hospitalists by Medicare beneficiaries: a national picture. Medicare Medicaid Res Rev. 2014;4(2):E1–E8.

[4] Lapps J, Flansbaum B, Leykum L, Boswell J, Haines L, Identification of Hospitalists. J. Hosp. Med 2016;1;45-47. doi:10.1002/jhm.2480

[5] Unpublished analysis by the Society of Hospital Medicine on Medicare Provider Utilization and Payment data show an average +2,200 increase in number of hospitalists identified year over year from 2012-2019. SHM is planning to seek publication of this data.

[6] Society of Hospital Medicine. 2020 State of Hospital Medicine Report. Published August 2020.

[7] Society of Hospital Medicine. 2020 State of Hospital Medicine Report. Published August 2020.

Finally, using 90% threshold-identified hospitalists to examine trends in Medicare billing data shows that, in 2019, hospitalists are billing the plurality of charges for nearly all the hospital visit E/M codes. For example, in 2019, hospitalists accounted for 10.2% of 99221, 15.1% of 99222 and 31.9% of 99223 of the total volume of Medicare bills for each of these codes.[8]

The RUC acknowledges that the existing Medicare data attributes a much smaller proportion of claims to hospitalists as this includes only the small proportion of hospitalists who voluntarily identified in the Medicare Provider Enrollment, Chain, and Ownership System (PECOS) using a recently established Medicare specialty billing code (C6), therefore underrepresenting the proportion of hospitalists who perform these services. Given the demonstrated growth in the number of hospitalists, the 2006 valuations reflected a provider mix that is no longer representative of the healthcare system today.

The RUC agrees that there is compelling evidence based on a change in patient population, change in technology, and change in the provider of these services.

99417 ***Prolonged outpatient evaluation and management service(s) time with or without direct patient contact beyond the required time of the primary service when the primary service level has been selected using total time, each 15 minutes of total time (List separately in addition to the code of the outpatient Evaluation and Management services)***
The RUC reviewed survey responses from 98 physicians and other qualified healthcare professionals and determined that a work RVU of 0.61 appropriately accounts for the physician work required to perform this service. This is the survey 25th percentile and current work RVU (for both 99417 and G2212). The RUC recommends 15 minutes of total time. It is important to note that this service may only be reported with CPT codes 99205, 99215, 99245, 99345, 99350 and 99483 and may not be reported for any time less than 15 minutes. The RUC noted that even though the CPT Editorial Panel revised the coding structure so 99417 will now also be reported with prolonged office consultations, home and domiciliary visits, and cognitive assessment and care plan services, most of the visits are expected to still be reported with the office visit codes 99205 and 99215. Even with the CPT parenthetical change, 99417 is expected to be reported a large majority of the time with office visits.

To justify a work RVU of 0.61, the RUC compared the surveyed code to top key reference code 99439 *Chronic care management services with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions that place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, comprehensive care plan established, implemented, revised, or monitored; each additional 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)* (work RVU= 0.70, total time of 20 minutes) and noted that although the reference code typically involves 5 more minutes of total time, the physician or QHP work described by the survey code of providing direct patient care for an office or other outpatient services for typically complex patient is more intense than time spent supervising clinical staff for a chronic care management service. Therefore, the RUC concurred with the specialties that the surveyed code is a more intense service to perform and should be assigned a work value somewhat lower than the reference code.

[8] Unpublished analysis by the Society of Hospital Medicine on publicly available Medicare Provider Utilization and Payment Data.

The RUC also compared the surveyed code to another office or other outpatient service, MPC code 99212 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter.* (work RVU= 0.70, total time of 16 minutes), and concurred with the specialties that a work RVU of 0.61 placed 99417 in proper rank order to 99212, an XXX-global code with a similar amount of total time. The RUC noted that a recommendation of 0.61 work RVUs and 15 minutes of total time would assign the surveyed code 99417 an intensity that is identical to the volume-weighted intensity assigned to office visit codes 99202-99215, the code family with which 99417 will most commonly be reported. The RUC also noted that 81% of the survey respondents concurred that the typical patient would either have a chronic illness with severe exacerbation that poses a threat to life or bodily function, or an acute illness/injury that poses a threat to life or bodily function. The RUC concluded that the value of CPT code 99417 should be maintained at 0.61 work RVUs as supported by the survey 25th percentile. **The RUC recommends a work RVU of 0.61 with 15 minutes total time for CPT code 99417.**

993X0 ***Prolonged inpatient or observation evaluation and management service(s) time with or without direct patient contact beyond the required time of the primary service when the primary service level has been selected using total time, each 15 minutes of total time (List separately in addition to the code of the inpatient and observation Evaluation and Management services)***
The RUC reviewed survey responses from 124 physicians and other qualified healthcare professionals and determined that the survey 25th percentile work RVU of 0.81 appropriately accounts for the physician work required to perform this service. The RUC recommends 20 minutes of total time. The RUC noted that this service may only be reported with CPT codes 99223, 99233, 99236, 99255, 99306, 99310 and may not be reported for any time less than 15 minutes.

To justify a work RVU of 0.81, the RUC compared the surveyed code to top key reference code 99439 *Chronic care management services with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions that place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, comprehensive care plan established, implemented, revised, or monitored; each additional 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)* (work RVU= 0.70, total time of 20 minutes) and noted that although both add-on E/M services require the same amount of total time, however, the physician or QHP work of providing direct patient care for an inpatient or observation visit is more intense than time spent supervising clinical staff for a chronic care management service. The RUC also compared the surveyed code to second key reference and MPC code 99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)* (work RVU= 2.25, total time of 30 minutes) and noted that the surveyed code, with 10 less minutes of total time and somewhat less intensity, maintains the appropriate relativity to this reference service. The RUC also noted that 86% of the survey respondents concurred that the typical patient would either have a chronic illness with severe exacerbation that poses a threat to life or bodily function, or an acute illness/injury that poses a threat to life or bodily function. **The RUC recommends a work RVU of 0.81 with 20 minutes total time for CPT code 993X0.**

Practice Expense
At the October 2021 RUC meeting, the Practice Expense Subcommittee reviewed the direct practice expenses and made modifications to remove all direct practice expense inputs from CPT code 993X0 since it is a facility-only code. The equipment input ED021 *Computer, desktop, w-monitor* was removed from CPT code 99417 on the basis that this is an indirect expense. Consistent with the current inputs for G2212 and the RUC's prior recommendations for 99417, equipment inputs EQ189 *otoscope-ophthalmoscope (wall unit)* and EF023 *exam table* were included in

the recommended inputs for code 99417 in the non-facility setting. Since it is an add-on to a face-to-face evaluation and management service in the outpatient (i.e., non-facility) setting and the patient will typically be occupying an exam room during the prolonged service. At the January 2022 meeting, the Practice Expense Subcommittee affirmed its previous recommendations from the October 2021 meeting. The Practice Expense Subcommittee had confirmed that the prolonged service would typically occur with the patient still in the room, and therefore, the otoscope-ophthalmoscope and the exam table would be present in the room the entire time during the typical prolonged service visit. The Practice Expense Subcommittee discussed how these codes are being used and requested that CPT code 99417 be reviewed by the RAW once claims data becomes available so that the RUC can learn whether it is being billed as solitary units or in multiples and confirm the typical scenario in which this code is reported. Even with the CPT parenthetical change, 99417 is expected to be reported a large majority of the time with office visits. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

Recommendation to Delete HCPCS code G2212

Currently (for CY 2022), the Centers for Medicare & Medicaid Services (CMS) assigns CPT code 99417 a Medicare Status of "I" *Not valid for Medicare purposes.* In lieu of 99417, Medicare uses another code for reporting prolonged office or outpatient services, G2212 *Prolonged office or other outpatient evaluation and management service(s) beyond the maximum required time of the primary procedure which has been selected using total time on the date of the primary service; each additional 15 minutes by the physician or qualified healthcare professional, with or without direct patient contact (list separately in addition to CPT codes 99205, 99215 for office or other outpatient evaluation and management services) (do not report g2212 on the same date of service as 99354, 99355, 99358, 99359, 99415, 99416). (Do not report g2212 for any time unit less than 15 minutes)*, though that code is redundant with the newly revised 99417, which has also been revised to be reported with prolonged office consultations, home and domiciliary visits and cognitive assessment and care plan services (99245, 99345, 99350, 99483) in addition to being reported with prolonged office or outpatient visit services (99205, 99215). **The RUC recommends for CMS to delete HCPCS code G2212.**

Relativity Assessment Workgroup Review

The RUC recommends that CPT code 99417 be re-reviewed by the RAW once Medicare claims data is available to learn whether it is being reported as solitary units or in multiples and confirm the typical scenario in which this code is reported. Even with the CPT parenthetical change, 99417 is expected to be reported a large majority of the time with office visits.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Evaluation and Management **Prolonged Services** ~~**Prolonged Service With Direct Patient Contact (Except with Office or Other Outpatient Services)**~~ ~~Codes 99354-99357 are used when a physician or other qualified health care professional provides prolonged service(s) involving direct patient contact that is provided beyond the usual service in either the inpatient, observation or outpatient setting, except with office or other outpatient~~				

~~services (99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215). Direct patient contact is face-to-face and includes additional non-face-to-face services on the patient's floor or unit in the hospital or nursing facility during the same session. This service is reported in addition to the primary procedure. Appropriate codes should be selected for supplies provided or other procedures performed in the care of the patient during this period.~~

~~Codes 99354-99355 are used to report the total duration of face-to-face time spent by a physician or other qualified health care professional on a given date providing prolonged service in the outpatient setting, even if the time spent by the physician or other qualified health care professional on that date is not continuous. Codes 99356-99357 are used to report the total duration of time spent by a physician or other qualified health care professional at the bedside and on the patient's floor or unit in the hospital or nursing facility on a given date providing prolonged service to a patient, even if the time spent by the physician or other qualified health care professional on that date is not continuous.~~

~~Time spent performing separately reported services other than the E/M or psychotherapy service is not counted toward the prolonged services time.~~

~~Code 99354 or 99356 is used to report the first hour of prolonged service on a given date, depending on the place of service.~~

~~Either code should be used only once per date, even if the time spent by the physician or other qualified health care professional is not continuous on that date. Prolonged service of less than 30 minutes total duration on a given date is not separately reported.~~

~~Code 99355 or 99357 is used to report each additional 30 minutes beyond the first hour, depending on the place of service. Either code may also be used to report the final 15-30 minutes of prolonged service on a given date. Prolonged service of less than 15 minutes beyond the first hour or less than 15 minutes beyond the final 30 minutes is not reported separately.~~

~~The use of the time based add-on codes requires that the primary evaluation and management service have a typical or specified time published in the CPT codebook.~~

~~For E/M services that require prolonged clinical staff time and may include face-to-face services by the physician or other qualified health care professional, use 99415, 99416. Do not report 99354, 99355 with 99415, 99416, 99417.~~

~~For prolonged total time in addition to office or other outpatient services (ie, 99205, 99215), use 99417.~~

~~The following table illustrates the correct reporting of prolonged physician or other qualified health care professional service with direct patient contact in the inpatient or observation setting beyond the usual service time.~~

~~**Total Duration of Prolonged Services**~~	~~**Code(s)**~~
~~less than 30 minutes~~	~~Not reported separately~~
~~30-74 minutes~~ ~~(30 minutes - 1 hr. 14 min.)~~	~~99356 X 1~~

	~~75-104 minutes (1 hr. 15 min. – 1 hr. 44 min.)~~	~~99356 X 1 AND 99357 X 1~~		
	~~105 or more (1 hr. 45 min. or more)~~	~~99356 X 1 AND 99357 X 2 or more for each additional 30 minutes.~~		
~~+ 99354~~	-	~~Prolonged evaluation and management or psychotherapy service(s) (beyond the typical service time of the primary procedure) in the office or other outpatient setting requiring direct patient contact beyond the usual service; first hour (List separately in addition to code for office or other outpatient **Evaluation and Management** or psychotherapy service)~~ ~~(Use 99354 in conjunction with 90837, 90847, 99241-99245, 99324-99337, 99341-99350, 99483)~~ ~~(Do not report 99354 in conjunction with 99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 99415, 99416, 99417)~~	~~ZZZ~~	~~N/A~~
~~+99355~~	-	~~each additional 30 minutes (List separately in addition to code for prolonged service)~~ ~~(Use 99355 in conjunction with 99354)~~ ~~(Do not report 99355 in conjunction with 99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 99415, 99416, 99417)~~	~~ZZZ~~	~~N/A~~
~~+99356~~	-	~~Prolonged service in the inpatient or observation setting, requiring unit/floor time beyond the usual service; first hour (List separately in addition to code for inpatient **Evaluation and Management** service)~~ ~~(Use 99356 in conjunction with 90837, 90847, 99218-99220, 99221-99223, 99224-99226, 99231-99233, 99234-99236, 99251-99255, 99304-99310)~~	~~ZZZ~~	~~N/A~~
~~+99357~~	-	~~each additional 30 minutes (List separately in addition to code for prolonged service)~~	~~ZZZ~~	~~N/A~~

		~~(Use 99357 in conjunction with 99356)~~ (99354, 99355 have been deleted. For prolonged evaluation and management services on the date of an office or other outpatient service, home and residence service, or cognitive assessment and care plan, use 99417. For prolonged psychotherapy, use 908X0) (99356, 99357 have been deleted. For prolonged service on the date of an inpatient or observation or nursing facility service, use 993X0. For prolonged psychotherapy, use 908X0)		

Prolonged Service With or Without Direct Patient Contact on the Date of an Evaluation and Management ~~Office or Other Outpatient~~ Service

Code 99417 is used to report prolonged total time (ie, combined time with and without direct patient contact) provided by the physician or other qualified health care professional on the date of office or other outpatient services, office consultation or other outpatient evaluation and management service (ie, 99205, 99215, 99245, 99345, 99350, 99483). Code 993X0 is used to report prolonged total time (ie, combined time with and without direct patient contact) provided by the physician or other qualified health care professional on the date of an inpatient service (ie, 99223, 99233, 99236, 99255, 99306, 99310). Prolonged total time is time that is 15 minutes beyond the time required to report the highest-level primary service. Codes 99417 and 993X0 ~~is~~ are only used when the primary ~~office or other outpatient~~ service has been selected using time alone as the basis and only after the ~~minimum~~ time required to report the highest-level service ~~(ie, 99205 or 99215)~~ has been exceeded by 15 minutes. To report a unit of 99417 or 993X0, 15 minutes of ~~additional~~ time must have been attained. Do not report 99417 or 993X0 for any ~~additional~~ time increment of less than 15 minutes.

~~The listed time ranges for 99205 (ie, 60-74 minutes) and 99215 (ie, 40-54 minutes) represent the complete range of time for which each code may be reported. Therefore,~~ When reporting 99417 or 993X0, the initial time unit of 15 minutes should be added once the ~~minimum~~ time in the primary E/M code has been surpassed by 15 minutes. For example, to report the initial unit of 99417 for a new patient encounter (99205), do not report 99417 until at least 15 minutes of time has been accumulated beyond 60 minutes (ie, 75 minutes) on the date of the encounter. For an established patient encounter (99215), do not report 99417 until at least 15 minutes of time has been accumulated beyond 40 minutes (ie, 55 minutes) on the date of the encounter.

Time spent performing separately reported services other than the primary E/M service and prolonged E/M service is not counted toward the primary E/M and ~~time to report 99205, 99215 and~~ prolonged services time.

For prolonged services on a date other than the date of a face-to-face evaluation and management encounter, ~~including office or other outpatient services (99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215),~~ see 99358, 99359. For E/M services that require prolonged clinical staff time and may include face-to-face services by the physician or other qualified health care professional ~~QHP~~, see 99415, 99416. Do not report 99417 or 993X0 in conjunction with ~~99354, 99355,~~ 99358, 99359, 99415, 99416.

~~Prolonged services of less than 15 minutes total time is not reported.~~ ~~on the date of office or other outpatient service when the highest level is reached (ie, 99205, 99215).~~

✚▲99417	K5	Prolonged ~~office or other~~ outpatient evaluation and management service(s) time with or without direct patient contact beyond the ~~minimum~~ required time ~~with or without direct patient contact beyond the usual service~~ of the primary service ~~procedure encounter which~~ when the primary service level has been selected using total time, ~~requiring total time with or without direct patient contact beyond the usual service, on the date of the primary service,~~ each 15 minutes of total time (List separately in addition to ~~codes 99205, 99215 for office or other~~ the code of the outpatient Evaluation and Management services) (Use 99417 in conjunction with 99205, 99215, 99245, 99345, 99350, 99483) (Do not report 99417 on the same date of service as ~~99354, 99355,~~ 90833, 90836, 90838, 99358, 99359, 99415, 99416) *(Do not report 99417 for any time unit less than 15 minutes)* (For prolonged psychotherapy services, use 908X0)	ZZZ	0.61 (no change)
✚●993X0	K6	Prolonged inpatient or observation evaluation and management service(s) time with or without direct patient contact beyond the required time of the primary service when the primary service level has been selected using total time, each 15 minutes of total time (List separately in addition to the code of the inpatient and observation Evaluation and Management services) (Use 993X0 in conjunction with 99223, 99233, 99236, 99255, 99306, 99310) (Do not report 993X0 on the same date of service as 90833, 90836, 90838, 99358, 99359) (Do not report 993X0 for any time unit less than 15 minutes)	ZZZ	0.81

(For prolonged psychotherapy services, use 908X0)

Total Duration of New Patient Office or Other Outpatient Services (use with 99205)	**Code(s)**
less than 75 minutes	Not reported separately
75-89 minutes	99205 X 1 AND 99417 X 1
90-104 minutes	99205 X 1 AND 99417 X 2
105 minutes or more	99205 X 1 AND 99417 X 3 or more for each additional 15 minutes
Total Duration of Office or Other Outpatient Consultation Services (use with 99245)	**Code(s)**
less than XX + 15 minutes	Not reported separately
XX+15 to XX+29 minutes	99245 X 1 AND 99417 X ~~2~~1
XX+30 to XX+44	99245 X 1 and 99417 X 2
XX+45 minutes or more	99245 X 1 AND 99417 X 3 or more for each additional 15 minutes

G2212		Prolonged office or other outpatient evaluation and management service(s) beyond the maximum required time of the primary procedure which has been selected using total time on the date of the primary service; each additional 15 minutes by the physician or qualified healthcare professional, with or without direct patient contact (list separately in addition to CPT codes 99205, 99215 for office or other outpatient evaluation and management services) (do not report g2212 on the same date of service as 99354, 99355, 99358, 99359, 99415, 99416). (Do not report g2212 for any time unit less than 15 minutes)	XXX	**Recommend for Deletion** (2021 work RVU = 0.61)

Comparison of Prolonged Services Codes 99354, 99355, 99356, 99357, 99358, 99359, 99417 Table

Code	Patient Contact	Minimum Reportable Prolonged Services Time (Single Date of Service)	Use In Conjunction With	*Do Not Report With	Other Prolonged Service(s) Reportable On Same Date Of Service
+99354	Face-to-Face Only	30 minutes (Beyond listed typical time)	90837, 90847, 99241-99245, 99324-99337, 99341-99350, 99483	99202-99215, 99415, 99416, 99417	99358, 99359
+99355	Face-to-Face Only	Each additional 15 minutes (Beyond 99354)	99354	99202-99215, 99415, 99416, 99417	99358, 99359

*Do not count the time of any separately reported service as Prolonged Services time 99355 is for prolonged services time beyond 99354 and may be reported in multiple units 99357 is for prolonged services time beyond 99356 and may be reported in multiple units 99359 is for prolonged services time beyond 99358 and may be reported in multiple units 99417 is for prolonged services time beyond 99205 or 99215 and may be reported in multiple units of at least 15 minutes					

CPT 2023 E/M Guidelines

Category I
Evaluation and Management (E/M) Services Guidelines

In addition to the information presented in the Introduction, several other items unique to this section are defined or identified here.

E/M Guidelines Overview

The E/M guidelines have sections that are common to all E/M categories and sections that are category specific. Most of the categories and many of the subcategories of service have special guidelines or instructions unique to that category or subcategory. Where these are indicated, eg, "Hospital Inpatient and Observation Care," special instructions are presented before the listing of the specific E/M services codes. It is important to review the instructions for each category or subcategory. These guidelines are to be used by the reporting physician or other qualified health care professional to select the appropriate level of service. These guidelines do not establish documentation requirements or standards of care. The main purpose of documentation is to support care of the patient by current and future health care team(s). These guidelines are for services that require a face-to-face encounter. (For 99211 and 99281 the face-to-face services may be performed by clinical staff).

In the **Evaluation and Management** section (99202-99499) there are many code categories. Each category may have specific guidelines, or the codes may include specific details. These E/M guidelines are written for the following categories:

- Office or Other Outpatient Services
- Hospital Inpatient and Observation Care Services
- Consultations
- Emergency Department Services
- Nursing Facility Services
- Home and Residence Services
- Prolonged Service With or Without Direct Contact on the Date of an Evaluation and Management Service

Classification of Evaluation and Management (E/M) Services

The E/M section is divided into broad categories such as office visits, hospital inpatient or observation care visits, and consultations. Most of the categories are further divided into two or more subcategories of E/M services. For example, there are two subcategories of office visits (new patient and established patient) and there are two subcategories of hospital inpatient and observation care visits (initial and subsequent). The subcategories of E/M services are further classified into levels of E/M services that are identified by specific codes.

The basic format of codes with levels of E/M services based on medical decision making (MDM) or time is the same. First, a unique code number is listed. Second, the place and/or type of service is specified, eg, office or other outpatient visit. Third, the content of the service is defined. Fourth, time is specified. (A detailed discussion of time is provided following the Decision Tree for New vs Established Patients.)

The place of service and service type is defined by the location where the face-to-face encounter occurs. For example, service provided to a nursing facility resident brought to the office is reported with an office or other outpatient code.

New and Established Patients

Solely for the purposes of distinguishing between new and established patients, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. A new patient is one who has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years.

An established patient is one who has received professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years. See Decision Tree for New vs Established Patients.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient's encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

No distinction is made between new and established patients in the emergency department. E/M services in the emergency department category may be reported for any new or established patient who presents for treatment in the emergency department.

The Decision Tree for New vs Established Patients is provided to aid in determining whether to report the E/M service provided as a new or an established patient encounter.

Coding Tip

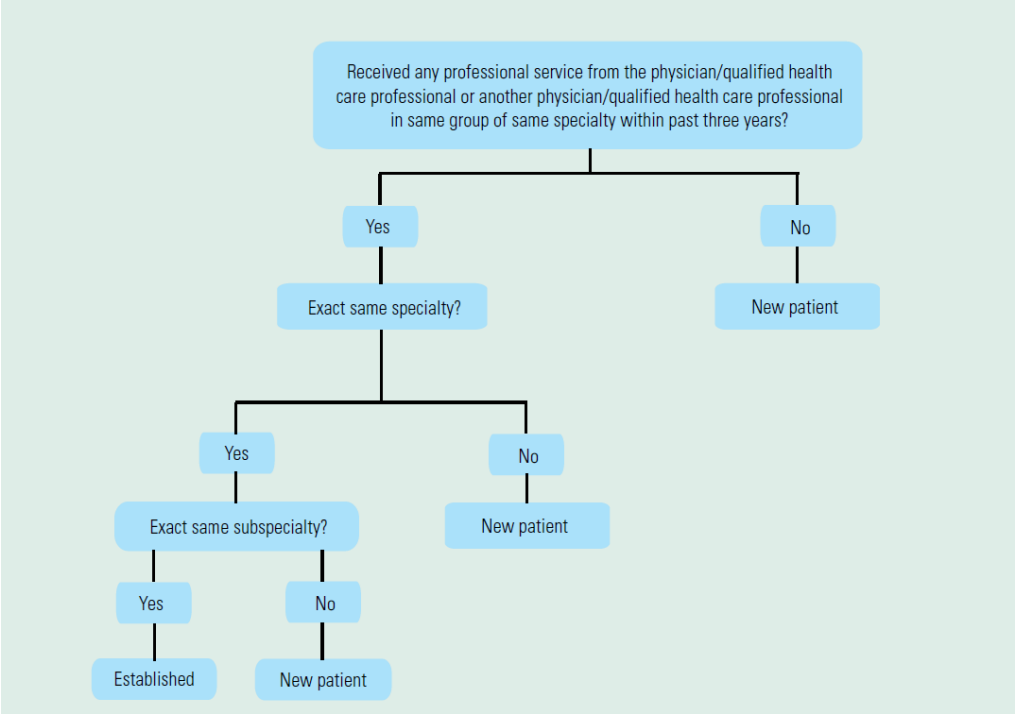
Instructions for Use of the CPT Codebook

When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and exact same subspecialty as the physician. A "physician or other qualified health care professional" is an individual who is qualified by education, training, licensure/regulation (when applicable), and facility privileging (when applicable) who performs a professional service within his or her scope of practice and independently reports that professional service. These professionals are distinct from "clinical staff." A clinical staff member is a person who works under the supervision of a physician or other qualified health care professional, and who is allowed by law, regulation and facility policy to perform or assist in the performance of a specific professional service but does not individually report that professional service. Other policies may also affect who may report specific services.

CPT Coding Guidelines, Introduction, Instructions for Use of the CPT Codebook

---

Decision Tree for New vs Established Patients



Initial and Subsequent Services

Some categories apply to both new and established patients (eg, hospital inpatient or observation care). These categories differentiate services by whether the service is the initial service or a subsequent service. For the purpose of distinguishing between initial or subsequent visits, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. An initial service is when the patient has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the inpatient or observation or nursing facility admission and stay.

A subsequent service is when the patient has received professional service(s) from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the admission and stay.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient's encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

For reporting hospital inpatient or observation care services, a stay that includes a transition from observation to inpatient is a single stay. For reporting nursing facility services, a stay that includes transition(s) between skilled nursing facility and nursing facility level of care is the same stay.

Services Reported Separately

Any specifically identifiable procedure or service (ie, identified with a specific CPT code) performed on the date of E/M services may be reported separately.

The ordering and actual performance and/or interpretation of diagnostic tests/studies during a patient encounter are not included in determining the levels of E/M services when the professional interpretation

of those tests/studies is reported separately by the physician or other qualified health care professional reporting the E/M service. Tests that do not require separate interpretation (eg, tests that are results only) and are analyzed as part of MDM do not count as an independent interpretation and may be counted as ordered or reviewed for selecting an MDM level.

The performance of diagnostic tests/studies for which specific CPT codes are available may be reported separately, in addition to the appropriate E/M code. The interpretation of the results of diagnostic tests/studies (ie, professional component) with preparation of a separate distinctly identifiable signed written report may also be reported separately, using the appropriate CPT code and, if required, with modifier 26 appended.

See Instructions for Selecting a Level Based on MDM or Time.

The physician or other qualified health care professional may need to indicate that on the day a procedure or service identified by a CPT code was performed, the patient's condition required a significant separately identifiable E/M service. The E/M service may be caused or prompted by the symptoms or condition for which the procedure and/or service was provided. This circumstance may be reported by adding modifier 25 to the appropriate level of E/M service. As such, different diagnoses are not required for reporting of the procedure and the E/M services on the same date.

History and/or Examination

These E/M services include a medically appropriate history and/or physical examination, when performed. The nature and extent of the history and/or physical examination are determined by the treating physician or other qualified health care professional reporting the service. The care team may collect information, and the patient or caregiver may supply information directly (eg, by electronic health record [EHR] portal or questionnaire) that is reviewed by the reporting physician or other qualified health care professional. The extent of history and physical examination is not an element in selection of the level of these E/M service codes.

Levels of E/M Services

Select the appropriate level of E/M services based on the following:

1. The level of the MDM as defined for each service, **or**

2. The total time for E/M services performed on the date of the encounter.

Within each category or subcategory of E/M service based on MDM or time, there are three to five levels of E/M services available for reporting purposes. Levels of E/M services are **not** interchangeable among the different categories or subcategories of service. For example, the first level of E/M services in the subcategory of office visit, new patient, does not have the same definition as the first level of E/M services in the subcategory of office visit, established patient. Each level of E/M services may be used by all physicians or other qualified health care professionals.

Guidelines for Selecting a level service based on Medical Decision Making

Four types of MDM are recognized: straightforward, low, moderate, and high. The concept of the level of MDM does not apply to 99211 or 99281.

MDM includes establishing diagnoses, assessing the status of a condition, and/or selecting a management option. MDM is defined by three elements. The elements are:

- ***The number and complexity of problem(s) that are addressed during the encounter***.
- ***The amount and/or complexity of data to be reviewed and analyzed.*** These data include medical records, tests, and/or other information that must be obtained, ordered, reviewed, and analyzed for the encounter. This includes information obtained from multiple sources or interprofessional communications that are not reported separately and interpretation of tests that are not reported

separately. Ordering a test is included in the category of test result(s) and the review of the test result is part of the encounter and not a subsequent encounter. Ordering a test may include those considered, but not selected after shared decision making. For example, a patient may request diagnostic imaging that is not necessary for their condition and discussion of the lack of benefit may be required. Alternatively, a test may normally be performed, but due to risk for a specific patient is not ordered. These considerations must be documented. Data are divided into three categories:

- Tests, documents, orders, or independent historian(s). (Each unique test, order, or document is counted to meet a threshold number.)
- Independent interpretation of tests (not separately reported)
- Discussion of management or test interpretation with external physician or other qualified health care professional or appropriate source (not separately reported)

- **The risk of complications and/or morbidity or mortality of patient management:** This includes decisions made at the encounter associated with the diagnostic procedure(s) and treatment(s). This includes the possible management options selected and those considered but not selected, after shared decision making with the patient and/or family. For example, a decision about hospitalization includes consideration of alternative levels of care. Examples may include a psychiatric patient with a sufficient degree of support in the outpatient setting or the decision to not hospitalize a patient with advanced dementia with an acute condition that would generally warrant inpatient care, but for whom the goal is palliative treatment.

Shared decision making involves eliciting patient and/or family preferences, patient and/or family education, and explaining risks and benefits of management options.

MDM may be impacted by role and management responsibility.

When the physician or other qualified health care professional is reporting a separate CPT code that includes interpretation and/or report, the interpretation and/or report is not counted toward the MDM when selecting a level of E/M services.

When the physician or other qualified health care professional is reporting a separate service for discussion of management with a physician or another qualified health care professional, the discussion is not counted toward the MDM when selecting a level of E/M services.

The Levels of Medical Decision Making (MDM) table (Table 2) is a guide to assist in selecting the level of MDM for reporting an E/M services code. The table includes the four levels of MDM (ie, straightforward, low, moderate, high) and the three elements of MDM (ie, number and complexity of problems addressed at the encounter, amount and/or complexity of data reviewed and analyzed, and risk of complications and/or morbidity or mortality of patient management). To qualify for a particular level of MDM, two of the three elements for that level of MDM must be met or exceeded.

Examples in the table may be more or less applicable to specific settings of care. For example, the decision to hospitalize applies to the outpatient or nursing facility encounters, whereas the decision to escalate hospital level of care (eg, transfer to ICU) applies to the hospitalized or observation care patient.

See also the introductory guidelines of each code family section.

Table 2: Levels of Medical Decision Making (MDM)

Level of MDM (Based on 2 out of 3 Elements of MDM)	Elements of Medical Decision Making		
	Number and Complexity of Problems Addressed at the Encounter	Amount and/or Complexity of Data to be Reviewed and Analyzed **Each unique test, order, or document contributes to the combination of 2 or combination of 3 in Category 1 below.*	Risk of Complications and/or Morbidity or Mortality of Patient Management
N/A	N/A	N/A	N/A
Straightforward	Minimal • 1 self-limited or minor problem	Minimal or none	Minimal risk of morbidity from additional diagnostic testing or treatment
Low	Low • 2 or more self-limited or minor problems; or • 1 stable, chronic illness; or • 1 acute, uncomplicated illness or injury or • 1 stable acute illness or • 1 acute, uncomplicated illness or injury requiring hospital inpatient or observation level of care	Limited *(Must meet the requirements of at least 1 of the 2 categories*) Category 1: Tests and documents • Any combination of 2 from the following: ○ Review of prior external note(s) from each unique source*; ○ Review of the result(s) of each unique test*; ○ Ordering of each unique test* or Category 2: Assessment requiring an independent historian(s) *(For the categories of independent interpretation of tests and discussion of management or test interpretation, see moderate or high)*	Low risk of morbidity from additional diagnostic testing or treatment

Moderate	Moderate
	• 1 or more chronic illnesses with exacerbation, progression, or side effects of treatment;
	or
	• 2 or more stable, chronic illnesses;
	or
	• 1 undiagnosed new problem with uncertain prognosis;
	or
	• 1 acute illness with systemic symptoms;
	or
	• 1 acute, complicated injury
		Moderate
		(Must meet the requirements of at least 1 out of 3 categories)
		Category 1: Tests, documents, or independent historian(s)
		• Any combination of 3 from the following:
		  ○ Review of prior external note(s) from each unique source*;
		  ○ Review of the result(s) of each unique test*;
		  ○ Ordering of each unique test*;
		  ○ Assessment requiring an independent historian(s)
		or
		Category 2: Independent interpretation of tests
		• Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);
		or
		Category 3: Discussion of management or test interpretation
		• Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)
			Moderate risk of morbidity from additional diagnostic testing or treatment
			
			Examples only:
			• Prescription drug management
			• Decision regarding minor surgery with identified patient or procedure risk factors
			• Decision regarding elective major surgery without identified patient or procedure risk factors
			• Diagnosis or treatment significantly limited by social determinants of health

High	High
	• 1 or more chronic illnesses with severe exacerbation, progression, or side effects of treatment;
	or
	• 1 acute or chronic illness or injury that poses a threat to life or bodily function
		Extensive
		(Must meet the requirements of at least 2 out of 3 categories)
		
		Category 1: Tests, documents, or independent historian(s)
		• Any combination of 3 from the following:
		  ○ Review of prior external note(s) from each unique source*;
		  ○ Review of the result(s) of each unique test*;
		  ○ Ordering of each unique test*;
		  ○ Assessment requiring an independent historian(s)
		or
		Category 2: Independent interpretation of tests
		• Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);
		or
		Category 3: Discussion of management or test interpretation
		• Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)
			High risk of morbidity from additional diagnostic testing or treatment
			
			Examples only:
			• Drug therapy requiring intensive monitoring for toxicity
			• Decision regarding elective major surgery with identified patient or procedure risk factors
			• Decision regarding emergency major surgery
			• Decision regarding hospitalization or escalation of hospital-level of care
			• Decision not to resuscitate or to de-escalate care because of poor prognosis
			• Parenteral controlled substances

Number and Complexity of Problems Addressed at the Encounter

One element used in selecting the level of services is the number and complexity of the problems that are addressed at the encounter. Multiple new or established conditions may be addressed at the same time and may affect MDM. Symptoms may cluster around a specific diagnosis and each symptom is not necessarily a unique condition. Comorbidities and underlying diseases, in and of themselves, are not considered in selecting a level of E/M services **unless** they are addressed, and their presence increases the amount and/or complexity of data to be reviewed and analyzed or the risk of complications and/or morbidity or mortality of patient management. The final diagnosis for a condition does not, in and of itself, determine the complexity or risk, as extensive evaluation may be required to reach the conclusion that the signs or symptoms do not represent a highly morbid condition. Therefore, presenting symptoms which are likely to represent a highly morbid condition may drive MDM even when the ultimate diagnosis is not highly morbid. The evaluation and /or treatment should be consistent with the likely nature of the condition. Multiple problems of a lower severity may, in the aggregate, create higher risk due to interaction.

The term "risk" as used in these definitions relates to risk from the condition. While condition risk and management risk may often correlate, the risk from the condition is distinct from the risk of the management.

Definitions for the elements of MDM (see Table 2, Levels of Medical Decision Making) are:

Problem: *A problem is a disease, condition, illness, injury, symptom, sign, finding, complaint, or other matter addressed at the encounter, with or without a diagnosis being established at the time of the encounter.*

Problem addressed: A problem is addressed or managed when it is evaluated or treated at the encounter by the physician or other qualified health care professional reporting the service. This includes consideration of further testing or treatment that may not be elected by virtue of risk/benefit analysis or patient/parent/guardian/surrogate choice. Notation in the patient's medical record that another professional is managing the problem without additional assessment or care coordination documented does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. Referral without evaluation (by history, examination, or diagnostic study[ies]) or consideration of treatment does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. For hospital inpatient and observation care services, the problem addressed is the problem status on the date of the encounter, which may be significantly different than on admission. It is the problem being managed or co-managed by the reporting physician or qualified health care professional and may not be the cause of admission or continued stay.

Minimal problem: A problem that may not require the presence of the physician or other qualified health care professional, but the service is provided under the physician's or other qualified health care professional's supervision (see 99211, 99281).

Self-limited or minor problem: *A problem that runs a definite and prescribed course, is transient in nature, and is not likely to permanently alter health status.*

Stable, chronic illness: A problem with an expected duration of at least one year or until the death of the patient. For the purpose of defining chronicity, conditions are treated as chronic whether or not stage or severity changes (eg, uncontrolled diabetes and controlled diabetes are a single chronic condition). "Stable" for the purposes of categorizing MDM is defined by the specific treatment goals for an individual patient. A patient who is not at his or her treatment goal is not stable, even if the condition has not changed and there is no short-term threat to life or function. For example, a patient with persistently poorly controlled blood pressure for whom better control is a goal is not stable, even if the pressures are not changing and the patient is asymptomatic. The risk of morbidity **without** treatment is significant.

Acute, uncomplicated illness or injury: A recent or new short-term problem with low risk of morbidity for which treatment is considered. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. A problem that is normally self-limited or minor but is not resolving consistent with a definite and prescribed course is an acute, uncomplicated illness.

Acute, uncomplicated illness or injury requiring hospital inpatient or observation level care: A recent or new short-term problem with low risk of morbidity for which treatment is required. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. The treatment required is delivered in a hospital inpatient or observation level setting.

Stable, acute illness: A problem that is new or recent for which treatment has been initiated. The patient is improved and while resolution may not be complete is stable with respect to this condition.

Chronic illness with exacerbation, progression, or side effects of treatment: A chronic illness that is acutely worsening, poorly controlled, or progressing with an intent to control progression and requiring additional supportive care or requiring attention to treatment for side effects.

Undiagnosed new problem with uncertain prognosis: A problem in the differential diagnosis that represents a condition likely to result in a high risk of morbidity without treatment.

Acute illness with systemic symptoms: An illness that causes systemic symptoms and has a high risk of morbidity without treatment. For systemic general symptoms, such as fever, body aches, or fatigue in a minor illness that may be treated to alleviate symptoms, see the definitions for **self-limited or minor problem** or **acute, uncomplicated illness or injury.** Systemic symptoms may not be general but may be single system.

Acute, complicated injury: An injury which requires treatment that includes evaluation of body systems that are not directly part of the injured organ, the injury is extensive, or the treatment options are multiple and/or associated with risk of morbidity.

Chronic illness with severe exacerbation, progression, or side effects of treatment: The severe exacerbation or progression of a chronic illness or severe side effects of treatment that have significant risk of morbidity and may require escalation in level of care.

Acute or chronic illness or injury that poses a threat to life or bodily function: An acute illness with systemic symptoms, an acute complicated injury, or a chronic illness or injury with exacerbation and/or progression or side effects of treatment, that poses a threat to life or bodily function in the near term without treatment. Some symptoms may represent a condition that is significantly probable and poses a potential threat to life or bodily function. These may be included in this category when the evaluation and treatment is consistent with this degree of potential severity.

Amount and/or Complexity of Data to be Reviewed and Analyzed

One element used in selecting the level of services is the amount and/or complexity of data to be reviewed or analyzed at an encounter.

Analyzed: Analyzed is a term describing the process of using the data as part of the MDM. The data element itself may not be subject to analysis (eg, glucose), but it is instead included in the thought processes for diagnosis, evaluation, or treatment. Tests ordered are presumed to be analyzed when the results are reported. Therefore, when they are ordered during an encounter, they are counted in that encounter. Tests that are ordered outside of an encounter may be counted in the encounter where they are analyzed. In the case of a recurring order, each new result may be counted in the encounter at which it is analyzed. For example, an encounter that includes an order for monthly prothrombin times would count for one prothrombin time ordered and reviewed. Additional future results, if analyzed in a subsequent encounter, may be counted as a single test in that subsequent encounter. Any service for which the professional component is separately reported by the physician or other qualified health care professional

reporting the E/M services is not counted as a data element ordered, reviewed, analyzed, or independently interpreted for the purposes of determining the level of MDM.

Test: Tests are imaging, laboratory, psychometric, or physiologic data. A clinical laboratory panel (eg, basic metabolic panel [80047]) is a single test. The differentiation between single or multiple tests is defined in accordance with the CPT code set. For the purposes of data reviewed and analyzed, pulse oximetry is not a test.

Unique: A unique test is defined by the CPT code set. When multiple results of the same unique test (eg, serial blood glucose values) are compared during an E/M service, only count one unique test. Tests that have overlapping elements are not unique, even if they are identified with distinct CPT codes. For example, a CBC with differential would incorporate the set of hemoglobin, CBC without differential, and platelet count. A unique source is defined as a physician or qualified heath care professional in a distinct group or different specialty or subspecialty, or a unique entity. Review of all materials from any unique source counts as one element towards MDM.

Combination of Data Elements: A combination of different data elements, for example a combination of notes reviewed, tests ordered, tests reviewed, or independent historian, allows these elements to be summed. It does not require each item type or category to be represented. A unique test ordered, plus a note reviewed and an independent historian would be a combination of three elements.

External: *External records, communications and/or test results are from an external physician, other qualified health care professional, facility, or health care organization.*

External physician or other qualified health care professional: *An external physician or other qualified health care professional who is not in the same group practice or is of a different specialty or subspecialty. This includes licensed professionals who are practicing independently. The individual may also be a facility or organizational provider such as from a hospital, nursing facility, or home health care agency.*

Discussion: Discussion requires an interactive exchange. The exchange must be direct and not through intermediaries (eg, clinical staff or trainees). Sending chart notes or written exchanges that are within progress notes does not qualify as an interactive exchange. The discussion does not need to be on the date of the encounter but is counted only once and only when it is used in the decision making of the encounter. It may be asynchronous (ie, does not need to be in person), but it must be initiated and completed within a short time period (eg, within a day or two).

Independent historian(s): An individual (eg, parent, guardian, surrogate, spouse, witness) who provides a history in addition to a history provided by the patient who is unable to provide a complete or reliable history (eg, due to developmental stage, dementia, or psychosis) or because a confirmatory history is judged to be necessary. In the case where there may be conflict or poor communication between multiple historians and more than one historian is needed, the independent historian requirement is met. It does not include translation services. The independent history does not need to be obtained in person but does need to be obtained directly from the historian providing the independent information.

Independent interpretation: The interpretation of a test for which there is a CPT code, and an interpretation or report is customary. This does not apply when the physician or other qualified health care professional who reports the E/M service is reporting or has previously reported the test. A form of interpretation should be documented but need not conform to the usual standards of a complete report for the test.

Appropriate source: *For the purpose of the* ***discussion of management*** *data element (see Table 2, Levels of Medical Decision Making), an appropriate source includes professionals who are not health care professionals but may be involved in the management of the patient (eg, lawyer, parole officer, case manager, teacher). It does not include discussion with family or informal caregivers.*

Risk of Complications and/or Morbidity or Mortality of Patient Management

One element used in selecting the level of services is the risk of complications and/or morbidity or mortality of patient management at an encounter. This is distinct from the risk of the condition itself.

Risk: The probability and/or consequences of an event. The assessment of the level of risk is affected by the nature of the event under consideration. For example, a low probability of death may be high risk, whereas a high chance of a minor, self-limited adverse effect of treatment may be low risk. Definitions of risk are based upon the usual behavior and thought processes of a physician or other qualified health care professional in the same specialty. Trained clinicians apply common language usage meanings to terms such as high, medium, low, or minimal risk and do not require quantification for these definitions (though quantification may be provided when evidence-based medicine has established probabilities). For the purposes of MDM, level of risk is based upon consequences of the problem(s) addressed at the encounter when appropriately treated. Risk also includes MDM related to the need to initiate or forego further testing, treatment, and/or hospitalization. The risk of patient management criteria applies to the patient management decisions made by the reporting physician or other qualified health care professional as part of the reported encounter.

Morbidity: *A state of illness or functional impairment that is expected to be of substantial duration during which function is limited, quality of life is impaired, or there is organ damage that may not be transient despite treatment.*

Social determinants of health: *Economic and social conditions that influence the health of people and communities. Examples may include food or housing insecurity.*

Surgery (minor or major, elective, emergency, procedure or patient risk):

> ***Surgery-Minor or Major:*** The classification of surgery into minor or major is based upon the common meaning of such terms when used by trained clinicians, similar to the use of the term "risk". These terms are not defined by a surgical package classification.
>
> ***Surgery-Elective or Emergency:*** Elective procedures and emergent or urgent procedures describe the timing of a procedure when the timing is related to the patient's condition. An elective procedure is typically planned in advance (eg, scheduled for weeks later), while an emergent procedure is typically performed immediately or with minimal delay to allow for patient stabilization. Both elective and emergent procedures may be minor or major procedures.
>
> ***Surgery-Risk Factors, Patient or Procedure:*** Risk factors are those that are relevant to the patient and procedure. Evidence-based risk calculators may be used, but are not required, in assessing patient and procedure risk.

Drug therapy requiring intensive monitoring for toxicity: A drug that requires intensive monitoring is a therapeutic agent that has the potential to cause serious morbidity or death. The monitoring is performed for assessment of these adverse effects and not primarily for assessment of therapeutic efficacy. The monitoring should be that which is generally accepted practice for the agent but may be patient-specific in some cases. Intensive monitoring may be long-term or short-term. Long-term intensive monitoring is not performed less than quarterly. The monitoring may be performed with a laboratory test, a physiologic test, or imaging. Monitoring by history or examination does not qualify. The monitoring affects the level of MDM in an encounter in which it is considered in the management of the patient. An example may be monitoring for cytopenia in the use of an antineoplastic agent between dose cycles. Examples of monitoring that do not qualify include monitoring glucose levels during insulin therapy, as the primary reason is the therapeutic effect (unless severe hypoglycemia is a current, significant concern); or annual electrolytes and renal function for a patient on a diuretic, as the frequency does not meet the threshold.

Guidelines for Selecting Level of Service Based on Time

Certain categories of time-based E/M codes that do not have levels of services based on MDM (eg, Critical Care Services) in the E/M section use time differently. It is important to review the instructions for each category.

Time is **not** a descriptive component for the emergency department levels of E/M services because emergency department services are typically provided on a variable intensity basis, often involving multiple encounters with several patients over an extended period of time.

When time is used for reporting E/M services codes, the time defined in the service descriptors is used for selecting the appropriate level of services. The E/M services for which these guidelines apply require a face-to-face encounter with the physician or other qualified health care professional. For office or other outpatient services, if the physician's or other qualified health care professional's time is spent in the supervision of clinical staff who perform the face-to-face services of the encounter, use 99211.

For coding purposes, time for these services is the total time on the date of the encounter. It includes both the face-to-face and non-face-to-face time personally spent by the physician and/or other qualified health care professional(s) on the day of the encounter (includes time in activities that require the physician or other qualified health care professional and does not include time in activities normally performed by clinical staff). It does not include any time spent in the performance of other separately reported service(s).

A shared or split visit is defined as a visit in which a physician and other qualified health care professional(s) both provide the face-to-face and non-face-to-face work related to the visit. When time is being used to select the appropriate level of services for which time-based reporting of shared or split visits is allowed, the time personally spent by the physician and other qualified health care professional(s) assessing and managing the patient on the date of the encounter is summed to define total time. Only distinct time should be summed for shared or split visits (ie, when two or more individuals jointly meet with or discuss the patient, only the time of one individual should be counted).

When prolonged time occurs, the appropriate prolonged services code may be reported. The total time on the date of the encounter spent caring for the patient should be documented in the medical record when it is used as the basis for code selection.

Physician or other other qualified health care professional time includes the following activities, when performed:

- preparing to see the patient (eg, review of tests)
- obtaining and/or reviewing separately obtained history
- performing a medically appropriate examination and/or evaluation
- counseling and educating the patient/family/caregiver
- ordering medications, tests, or procedures
- referring and communicating with other health care professionals (when not separately reported)
- documenting clinical information in the electronic or other health record
- independently interpreting results (when not separately reported) and communicating results to the patient family/caregiver
- care coordination (when not separately reported)

Do not count time spent on the following:

- the performance of other services reported separately

- travel
- teaching that is general and not limited to discussion that is required for the management of the specific patient

Unlisted Service

An E/M service may be provided that is not listed in this section of the CPT codebook. When reporting such a service, the appropriate unlisted code may be used to indicate the service, identifying it by "Special Report," as discussed in the following paragraph. The "Unlisted Services" and accompanying codes for the E/M section are as follows:

***99429 Unlisted preventive** medicine service*

***99499 Unlisted evaluation and management** service*

Special Report

An unlisted service or one that is unusual, variable, or new may require a special report demonstrating the medical appropriateness of the service. Pertinent information should include an adequate definition or description of the nature, extent, and need for the procedure and the time, effort, and equipment necessary to provide the service. Additional items that may be included are complexity of symptoms, final diagnosis, pertinent physical findings, diagnostic and therapeutic procedures, concurrent problems, and follow-up care.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99417 Tracking Number Original Specialty Recommended RVU: **0.61**
Presented Recommended RVU: **0.61**
Global Period: ZZZ Current Work RVU: **0.00** RUC Recommended RVU: **0.61**

CPT Descriptor: Prolonged outpatient evaluation and management service(s) time with or without direct patient contact beyond the required time of the primary service when the primary service level has been selected using total time, each 15 minutes of total time (List separately in addition to the code of the outpatient Evaluation and Management services)
(Use 99417 in conjunction with 99205, 99215, 99245, 99345, 99350, 99483)
(Do not report 99417 on the same date of service as 90833, 90836, 90838, 99358, 99359, 99415, 99416)
(Do not report 99417 for any time unit less than 15 minutes)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Office visit for a patient with a chronic illness with severe exacerbation that poses a threat to life or bodily function, or an acute illness/injury that poses a threat to life or bodily function.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: (not applicable)

Description of Intra-Service Work: Continue the work of evaluation and management lasting 15 minutes beyond the time of the usual service, either face-to-face or non-face-to-face. Includes tasks, such as formulating a treatment plan; discussing the diagnoses, workup, and treatment options with patient and family; providing additional patient education and responding to questions; analyzing test results; documenting the encounter in the medical record and additional discussions with other physicians and qualified health care professionals (QHPs); coordinating additional care with other physicians or members of the health care team necessary for additional work.

Description of Post-Service Work: (not applicable)

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99439	ZZZ	0.70	**RUC Time**

CPT Descriptor Chronic care management services with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, comprehensive care plan established, implemented, revised, or monitored; each additional 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99292	ZZZ	2.25	**RUC Time**

CPT Descriptor Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
74220	XXX	0.60	**RUC Time**	196,573

CPT Descriptor 1 Radiologic examination, esophagus, including scout chest radiograph(s) and delayed image(s), when performed; single-contrast (eg, barium) study

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
20552	000	0.66	**RUC Time**	350,667

CPT Descriptor 2 Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 65 **% of respondents:** 66.3 **%**

Number of respondents who choose 2nd Key Reference Code: 14 **% of respondents:** 14.2 **%**

TIME ESTIMATES (Median)

	CPT Code: 99417	**Top Key Reference CPT Code:** 99439	**2nd Key Reference CPT Code:** **99292**

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	6%	26%	44%	24%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	6%	27%	67%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	45%	47%
Physical effort required	11%	48%	41%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	6%	29%	65%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	29%	57%	14%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	29%	50%	21%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	43%	50%	7%
Physical effort required	29%	57%	14%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	29%	43%	28%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The prolonged services code family was surveyed because CPT created a new code, 993X0, for prolonged physician services furnished to an inpatient on the date of an inpatient visit which is to be reported based on time beyond that for 99233.

These codes, along with 99358 and 99359 were surveyed for the October 2021 RUC meeting. At that meeting, the RUC made recommendations for time and RVW for 99358 and 99359 but was unable to make recommendations for 99417 and 993X0 because the number of respondents to those surveys did not meet the minimum number of responses required by the RUC. Therefore, there was insufficient data upon which to make recommendations, and the RUC approved keeping the survey open of these two codes.

The surveys were done, and this time, a sufficient number of responses were obtained.

The surveying societies established an expert panel to review the survey data and make recommendations to the RUC.

99417

The expert panel noted that CMS does not currently recognize 99417 because it has established, G2212, Prolonged office or other outpatient evaluation and management service(s) beyond the maximum required time of the primary procedure which has been selected using total time on the date of the primary service; each additional 15 minutes by the physician or qualified healthcare professional, with or without direct patient contact (list separately in addition to CPT codes 99205, 99215 for office or other outpatient evaluation and management services) (do not report G2212 on the same date of service as 99354, 99355, 99358, 99359, 99415, 99416). (do not report G2212 for any time unit less than 15 minutes)

For code 99417 (Prolonged office or other outpatient evaluation and management service(s) beyond the minimum required time of the primary procedure which has been selected using total time, requiring total time with or without direct patient contact beyond the usual service, on the date of the primary service, each 15 minutes of total time (List separately in addition to codes 99205, 99215 for office or other outpatient Evaluation and Management services)).

This code was surveyed for the October 2021 RUC meeting with the following results: there were 52 respondents of whom 77% found the vignette to be typical. 99417 is a ZZZ global so all the time is intraservice time. The survey times were 0/15/0/15, the median RVW was 0.95 and the 25th percentile RVW was 0.63.

The current survey that includes the data from the October extended survey, had 98 respondents of whom 81% found the vignette to be typical. 99417 is a ZZZ global so all the time is intra-service time. The survey times were 0/15/0/15, the median RVW was 0.97 and the 25th percentile RVW was 0.61.

The panel also noted that 99417 was surveyed for the April 2019 RUC meeting. The results of that survey were times of 0/15/0/15 and the median RVW was 0.75. That survey was conducted by over 40 specialty societies and had 1,112 respondents. The surveying specialties recommended an RVW of 0.61 to the RUC based on a direct crosswalk to 99490, Chronic care management services with the following required

elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, comprehensive care plan established, implemented, revised, or monitored; first 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month.

G2212 has times of 0/15/0/15 and a RVW of 0.61. These values were established by CMS using a direct crosswalk for time and RVW to 99490.

The expert panel also reviewed the two key reference services, 99439, Chronic care management services with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, comprehensive care plan established, implemented, revised, or monitored; each additional 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure), which has times and RVW of 0/15/0/15/0.54, and 99292, Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service), which has times and RVW of 0/30/0/30 and 2.25, respectively. The expert panel noted that 65 of the 98 respondents chose 99439 as the key reference service.

The expert panel agreed that work of 99417 has not changed since the 2019 survey and that the survey 25th percentile RVW of 0.61 (survey for this meeting) matches the existing value for G2212.

The expert panel also noted that 99439 is reported based on staff time for chronic care management under a physician's direction while 99417 is reported based on physician time and that 99417 can only be reported after the physician spends at least 15 minutes of time. Therefore, the panel agreed that the RVW for 99417 should be higher than the RVW for 99439 to maintain proper relativity.

The panel also reviewed 99490 and agreed that maintaining the current crosswalk to that code, consistent with the previous RUC recommendation and the CMS crosswalk, was appropriate

The expert panel also reviewed MPC code 99212, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter, Code 99212 has times of 2/11/3/16 and an RVW of 0.70. The specialties agreed that an RVW of 0.61 placed 99417 in proper rank order to 99212.

Lastly, the expert panel noted that 99417 is typically reported after 99215, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter. As another validation, the panel noted that the survey time of 15 minutes is 21% of the total time for 99215 and that 21% of 2.80 = 0.60.

Therefore, the expert panel recommends a total and intra time of 15 minutes, and an RVW of 0.61.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

	Code	Global	Work RVU	Pre-Time	Intra-Time	Post-Time
3.	99417	ZZZ	0.61	0	15	0
4.	99215	XXX	2.80	10	45	15
5.	Total		3.41	10	60	15

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) G2212

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Nurse Practitioner How often? Sometimes

Specialty Family Medicine How often? Sometimes

Specialty Internal Medicine How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 10370573
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. (See attached spreadsheet)

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,392,023 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. (See attached spreadsheet)

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99417

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:993X0 Tracking Number Original Specialty Recommended RVU: **0.81**
Presented Recommended RVU: **0.81**
Global Period: ZZZ Current Work RVU: **(N/A)** RUC Recommended RVU: **0.81**

CPT Descriptor: Prolonged inpatient evaluation and management service(s) time with or without direct patient contact beyond the required time of the primary service when the primary service level has been selected using total time, each 15 minutes of total time (List separately in addition to the code of the inpatient Evaluation and Management services)
(Use 993X0 in conjunction with 99223, 99233, 99236, 99255, 99306, 99310)
(Do not report 993X0 on the same date of service as 90833, 90836, 90838, 99358, 99359)
(Do not report 993X0 for any time unit less than 15 minutes)
(For prolonged psychotherapy services, use 908X0)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Hospital visit for a patient with a chronic illness with severe exacerbation that poses a threat to life or bodily function, or an acute illness/injury that poses a threat to life or bodily function.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: (not applicable)

Description of Intra-Service Work: Continue the work of evaluation and management lasting 15 minutes beyond the time of the usual service, either face-to-face or non-face-to-face. Includes tasks, such as formulating a treatment plan; discussing the diagnoses, workup, and treatment options with patient and family; providing additional patient education and responding to questions; analyzing test results; documenting the encounter in the medical record and additional discussions with other physicians and qualified health care professionals (QHPs); coordinating additional care with other physicians or members of the health care team necessary for additional work.

Description of Post-Service Work: (not applicable)

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99439	ZZZ	0.70	**RUC Time**

CPT Descriptor Chronic care management services with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, comprehensive care plan established, implemented, revised, or monitored; each additional 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99292	ZZZ	2.25	**RUC Time**

CPT Descriptor Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
51797	ZZZ	0.80	**RUC Time**	116,064

CPT Descriptor 1 Voiding pressure studies, intra-abdominal (ie, rectal, gastric, intraperitoneal) (List separately in addition to code for primary procedure)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization

12001	000	0.84	**RUC Time**	184,284

CPT Descriptor 2 Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 51 **% of respondents:** 41.1 **%**

Number of respondents who choose 2nd Key Reference Code: 41 **% of respondents:** 33.0 **%**

TIME ESTIMATES (Median)

	CPT Code: 993X0	**Top Key Reference CPT Code:** 99439	**2nd Key Reference CPT Code:** **99292**
Median Pre-Service Time	0.00	0.00	0.00
Median Intra-Service Time	20.00	20.00	30.00
Median Immediate Post-service Time	0.00	0.00	0.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	2%	2%	17%	54%	25%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	5%	24%	71%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	17%	44%	39%
Physical effort required	24%	34%	42%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	29%	66%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	22%	46%	20%	12%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	20%	51%	29%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	32%	49%	19%
Physical effort required	20%	61%	19%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	20%	44%	36%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Additional Rationale and Comments

The prolonged services code family was surveyed because CPT created a new code, 993X0, for prolonged physician services furnished to an inpatient on the date of an inpatient visit which is to be reported based on time beyond that for 99233.

These codes, along with 99358 and 99359 were surveyed for the October 2021 RUC meeting. At that meeting, the RUC made recommendations for time and RVW for 99358 and 99359 but was unable to make recommendations for 99417 and 993X0 because the number of respondents to those surveys did not meet the minimum number of responses required by the RUC. Therefore, there was insufficient data upon which to make recommendations, and the RUC approved keeping the survey open of these two codes.

The surveys were done, and this time, a sufficient number of responses were obtained.

The surveying societies established an expert panel to review the survey data and make recommendations to the RUC.

Compelling Evidence

The surveying societies discussed with the pre-facilitation committee whether there is a need for compelling evidence associated with the recommended value for code 993X0. An initial analysis done by AMA RUC staff using values and volumes for codes 99356 and 99357 as a point of comparison suggested compelling evidence might be needed to consider the recommended value for 993X0.

Based on feedback from the pre-facilitation committee, the surveying societies believe compelling evidence is not needed to consider the recommended value of 993X0, because this code represents a different service that is not comparable to 99356 and 99357 for the following reasons:

- Per the CPT guidelines shown in the cover to this tab, "Codes 99417 and 993X0 are only used when the primary service has been selected using time alone as the basis…." No such limitation applies to 99356 and 99357.
- Codes 99356 and 99357 may be reported in addition to any level of service within the inpatient/observation code families. Code 993X0 may only be reported in addition to the highest level of service.
- Code 993X0 includes both unit/floor time and time off the unit/floor on the date of service. Codes 99356/99357 include only unit/floor time.

If the RUC reaches a different conclusion than its pre-facilitation committee and believes compelling evidence is needed to consider the recommended value for 993X0, the surveying societies would cite the same compelling evidence used to consider an increase in the value of 99233 (Tab 13), one of the codes to which 993X0 may be added.

In effect, code 993X0 is part of the inpatient/observation care family of services. It is an extension of the highest level of service in that family when the primary service level has been selected using time. As detailed in the Summary of Recommendation for code 99233, there is documentation by "Other reliable data" for a change in physician work attributable to:

a. Change in patient population evidenced by an increasing number of diagnoses
b. Change in length of hospital stay
c. Change in Technology (i.e., increasing prevalence of the inpatient electronic health record)
d. Change in Knowledge (as reflected in the advent and increasing prevalence of hospitalist provider type)

The surveying societies believe these compelling evidence arguments apply to 993X0 in much the same way they apply to the base code of 99233 and that any one of these arguments is sufficient to justify consideration of the recommended value.

993X0

The surveying societies established an expert panel to review the survey data and make recommendations to the RUC.

Code 993X0 (Prolonged inpatient or observation evaluation and management service(s) time with or without direct patient contact beyond the required time of the primary service when the primary service level has been selected using total time, each 15 minutes of total time (List separately in addition to the code of the inpatient and observation Evaluation and Management services)) is the inpatient counterpart to 99417 in that it describes the same prolonged services but is reported only after an inpatient code is reported based on total time. Therefore, it is typically reported after 99233, Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Typically, 35 minutes are spent at the bedside and on the patient's hospital floor or unit.

This code was surveyed for the October 2021 RUC meeting with the following results: there were 32 respondents of whom 78% found the vignette to be typical. The survey times were 0/15/0/15, the survey median RVW was 1.23, and the survey 25th percentile RVW was 0.98.

The continued survey resulted in a total of 124 respondents of whom 86% found the vignette to be typical. The survey times were 0/20/0/20, the survey median RVW was 1.05, and the survey 25th percentile RVW was 0.81.

As an initial matter, the expert panel noted that the survey time of 20 minutes was higher than the survey time of 15 minutes for the limited data in the October survey. In addition, the median and 25th percentile RVWs were lower than those for the October limited survey.

The two key reference services were 99439, Chronic care management services with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, comprehensive care plan established, implemented, revised, or monitored; each additional 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure), which has times and RVW of 0/15/0/15/0.54, and 99292, Critical care, evaluation and

management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service), with times and RVW of 0/30/0/30/2.25.

The expert panel agreed that the RVW for 993X0 should be higher than that of 99439 because the work of direct care by a QHP is more intense than time spent supervising clinical staff. The expert panel also agreed that the work of 993X0 should be higher than that of 99417 because the site of service is inpatient, and the intensity of inpatient work is higher than outpatient work.

The expert panel also noted that 993X0 will only be reported after 99233, when 99233 is reported based on time. In other words, 993X0 will only be reported for the most difficult inpatients, when the time exceeds the time for 99233.

The panel also reviewed ZZZ global, RUC reviewed codes with total and intra times of 20 minutes. There were 25 such codes. The RVWs for these 25 codes ranged from 0.37 to 2.75 with a median RVW of 1.18. The panel focused its review on four codes that were recently reviewed by the RUC and where CMS agreed with the recommendation

- 88334, Pathology consultation during surgery with an RVW of 0.73 (RUC review 2016)
- 97598, Debridement, open wound, with an RVW of 0.50 (RUC review 2018)
- 99458, Remote physiologic monitoring, each additional 20 minutes of clinical staff or QHP time, with an RVW of 0.61 (RUC review 2019)
- 10008, Fine needle aspiration, with an RVW of 1.18 (RUC review 2017)

After its review, the expert panel agreed that the 25th percentile RVW of 0.81 placed 993X0 in proper rank order to both key references services, to the MPC codes it reviewed, and to 99417.

Therefore, the expert panel recommends a time of 20 minutes, all intra-service, and an RVW of 0.81 for 993X0.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

	Code	Global	Work RVU	Pre-Time	Intra-Time	Post-Time
3.	993X0	ZZZ	0.81	0	20	0
4.	99233	XXX	2.00	10	30	15

5.	5. Total	2.81	10	50	15

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) (not applicable)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Nurse Practitioner How often? Sometimes

Specialty Internal Medicine How often? Sometimes

Specialty Family Medicine How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 28628363
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. (see attached spreadsheet)

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,842,733 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. (see attached spreadsheet)

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 99233

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

	past medical records are needed from the patient's prior physicians or other qualified healthcare professionals and they are reviewed upon arrival.
+99359	An 85-year-old new patient with multiple complicated medical problems has moved to the area to live closer to her daughter. The physician or other qualified healthcare professional indicated that past medical records are needed from the patient's prior physicians or other qualified healthcare professionals and they are reviewed upon arrival.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   A consensus panel consisting of RUC advisors and subject matter experts from the surveying societies met via conference calls to review any data and existing PE inputs to develop the final recommendations presented in the PE worksheet.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (NOTE: *For services reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

   Current codes, plus recent E/M April 2019 survey RUC approved and CMS final recommendations.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see the *Billed Together* tab in the RUC Database)

   Codes 99358 and 99359 are not typically reported on the same day of service as an E/M code. Codes 99417 and 993X0 are add-on codes for certain E/M services, which are identified in parentheticals following the code descriptors.

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see the *Billed Together* tab in the RUC Database)

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment, and supplies, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

Not applicable.

(NOTE: CMS does not currently recognize code 99417 for payment. The recommended inputs for code 99417 are the same as those that CMS currently includes in G2212 (Prolonged office or other outpatient evaluation and management service(s) beyond the maximum required time of the primary procedure which has been selected using total time on the date of the primary service; each additional 15 minutes by the physician or qualified healthcare professional, with or without direct patient contact (list separately in addition to CPTcodes 99205, 99215 for office or other outpatient evaluation and management services) (do not report g2212 on the same date of service as 99354, 99355, 99358, 99359, 99415, 99416). (do not report g2212 for any time unit less than 15 minutes).)

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

6. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

N/A

7. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

N/A

8. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

9. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

10. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

    b. Service period (includes pre, intra and post):

    c. Post-service period:

Can be a combination of additional time for additional notes in the appropriate charts, and or calls above the E/M.

11. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

N/A

12. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

13. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet*):

N/A

14. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

15. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

16. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

17. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet*) please provide a paid invoice. Identify and explain the supply input and invoice here:

18. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

N/A

19. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

20. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet*) please provide a paid invoice. Identify and explain the equipment input and invoice here:

N/A

21. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (*please see fifth worksheet in PE spreadsheet*):

N/A

22. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

No equipment minutes are recommended for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038.

23. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time)*. If you have selected "other formula" for any of the equipment please explain here:

The use of some space to conduct the prolonged services is necessary. We followed the guidance of the E/M outpatient services below: The specialty societies recommend the "Office Visits" equipment formula for EQ189 otoscope-ophthalmoscope (wall unit) and EF023 table, exam for code 99417.

25. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated after the meeting and resubmitted asap.

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business. In addition, please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

- All direct practice expense inputs were removed from code 993X0 since it is a facility-only code.
- Equipment ED021, *Computer, desktop, w-monitor,* was removed from the recommended inputs for codes 99417, 99358, and 99359 on the basis that this is an indirect expense.
- Equipment EQ189, *otoscope-ophthalmoscope (wall unit)*, and EF023, *exam table*, were removed from the recommended inputs for 99358 and 99359 since the patient is not present for these services.
- Consistent with the current inputs for G2212 and the RUC's prior recommendations for 99417, equipment EQ189, *otoscope-ophthalmoscope (wall unit)*, and EF023, *exam table*, were included in the recommended inputs for code 99417 in the non-facility setting, since it is an add-on to a face-to-face evaluation and management service in the outpatient (i.e., non-facility) setting and the patient will typically be occupying an exam room during the prolonged service.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS Request – Final Rule for 2022

January 2022

Delayed Creation of Exit Site from Embedded Catheter (Review PE Only) – Tab 16

In the Final Rule for 2022, CMS requested practice expense (PE) information for the non-facility/office setting for CPT code 49436 upon public nomination that this code can be safely performed in the non-facility/office but is not priced in this setting. CMS agreed that CPT code 49436 can be safely performed in the non-facility/office. Further, valuing the code in the non-facility could ease the burden to the provider and the patient when trying to coordinate access to ambulatory surgical center (ASC) restricted schedules during the continued severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) (coronavirus disease 2019 [COVID-19]) public health emergency (PHE). CMS finalized CPT code 49436 as potentially misvalued and indicated it is appropriate to explore establishing a practice expense relative value in the non-facility/office setting. Therefore, the RUC reviewed the PE inputs for this low volume service at its January 2022 meeting.

The PE Subcommittee agreed with the specialty society that there is compelling evidence to support an increase in the direct PE inputs based on a change in site-of-service to the non-facility/office setting.

The PE Subcommittee reviewed the practice expense recommendations for this code and approved the inputs with no modifications. Several new supply items were identified, and invoices have been obtained and submitted. The clinical staff type was questioned, and ultimately supported as L051A RN, not a blend, for CA011 *Provide education/obtain consent* and CA018 *Assist physician or other qualified healthcare professional-directly related to physician work time (100%)*. According to the specialty society, a significant amount of education will be provided about the procedure and care of the externalized catheter and pending dialysis by a registered nurse who is familiar with peritoneal dialysis. A surgeon who would perform this procedure in the office setting will have a registered nurse as clinical staff available for this education. Further, the clinical staff for this surgical procedure will typically be a registered nurse who is familiar with peritoneal dialysis catheter care and who will assist 100% of the time (incision, irrigation, heparin flush, connection supplies, dressings). All of the other clinical activities would not require a nurse so they have instead been assigned the L037D RN/LPN/MTA blend staff type.

The PE Subcommittee requested clarification whether it is typical to perform a 99212 post-operative office visit within the global period for 49436. The specialty noted that this visit is typical for suture removal, to ensure the site does not get infected and is typically performed by the physician who performed the procedure. The clinical staff assist the surgeon during the post-operative office visit for a wound and catheter check. **The RUC recommends the direct practice expense inputs as submitted by the specialty society for CPT code 49436.**

Relativity Assessment Workgroup Review
The RUC recommends that the Relativity Assessment Workgroup review CPT code 49436 when three years of claims data are available to assess if there is a shift in the specialty performing these services.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation

49436	Delayed creation of exit site from embedded subcutaneous segment of intraperitoneal cannula or catheter	010

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
49436	A 26-year old male with chronic renal failure elects early placement of a subcutaneously embedded peritoneal dialysis catheter. Eleven months later, his renal function suddenly declines and he is experiencing uremic symptoms. The embedded subcutaneous segment of the catheter is urgently exteriorized. The patient immediately begins full dose peritoneal dialysis without a break-in period and successfully avoids the need for vascular catheter placement and temporary hemodialysis.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   In the Final Rule for 2022, CMS received a public nomination with documentation that 49436 can be safely performed in the non-facility/office setting. CMS requested practice expense information for the nonfacility setting for this code.
   The American College of Surgeons consulted with surgical experts familiar with performing this procedure in the office setting to determine the necessary clinical staff, supplies, and equipment.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (NOTE: *For services reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

   The current code is being used as a reference.

3. Is this code(s) typically reported with an E/M service?

   no

4. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence. (Please see *PE compelling evidence guidelines* on Collaboration). Please explain if the increase can be entirely accounted for because of an increase in physician time:

   n/a

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require either minimal or extensive use of clinical staff and

has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

no

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

When performed in the facility setting, the patient will need immediate dialysis and extensive clinical staff time (30 minutes) will be required to facilitate authorization and referral forms; obtain interval labs and prior surgical procedure operative reports for surgical planning of upcoming procedure; confirm availability of all necessary catheters and supplies; and contact patient/caregiver to provide education about the planned procedure, subsequent dialysis, need for supplies at home to care for the catheter, and regarding any changes to medications and diet prior to the procedure.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

no

8. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

When performed in the facility setting, the patient will need immediate dialysis and extensive clinical staff time (30 minutes) will be required to facilitate authorization and referral forms; obtain interval labs and prior surgical procedure operative reports for surgical planning of upcoming procedure; confirm availability of all necessary catheters and supplies; and contact patient/caregiver to provide education about the planned procedure, subsequent dialysis, need for supplies at home to care for the catheter, and regarding any changes to medications and diet prior to the procedure.

   b. Service period (includes pre, intra and post):

Activity	FAC	Comments
Discharge day management	**6**	When this is performed in facility setting, clinical staff will request transfer of facility records for entry into patient's office chart and contact patient/caregiver to answer questions about catheter care and activity restrictions

   c. Post-service period:

Clinical staff will assist surgeon during postop office visit for a wound and catheter check

9. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet*):

n/a

5. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence. (Please see *PE compelling evidence guidelines* on Collaboration). Please explain if the increase can be entirely accounted for because of an increase in physician time:

\
CMS established a process for the public to nominate potentially misvalued codes. In the CY 2015 PFS final rule with comment period (79 FR 67606 through 67608), CMS modified this process whereby the public and stakeholders may nominate potentially misvalued codes for review by submitting the code with supporting documentation that address specific criteria of compelling evidence. A stakeholoder offered the following information through comments:

• ***Documentation in peer reviewed medical literature or other reliable data that demonstrate changes in physician work due to one or more of the following: technique, knowledge and technology, patient population, site-of-service, length of hospital stay, and work time.***

The July 10, 2019 "Executive Order on Advancing American Kidney Health" encourages increased use of home dialysis. The embedded catheter strategy is in alignment with this order. Office-based creation of an exit site from an embedded catheter promotes safe patient access to this service outside a facility in a community setting.

• **An anomalous relationship between the code being proposed for review and other codes.**

Code 49418 which is a similar service, is priced in the office setting even though the percentage of claims (and absolute number of claims) in an office setting is significantly lower.

• ***Evidence that incorrect assumptions were made in the previous valuation of the service, such as a misleading vignette, survey, or flawed crosswalk assumptions in a previous evaluation.***

When code 49436 was established, it was not envisioned to be a procedure that would be performed in the office, and therefore, office-pricing was not requested. Since that time, practitioners who regularly utilize the embedded catheter strategy prefer the office location for externalization, while acknowledging that catheters may need to be externalized in the facility setting when a patient is emergently hospitalized for hyperkalemia, fluid overload, there is an urgent need for angiography, or any situation aggravated by an acute decline in renal function. The original evaluation of the code 49436 did not include practice expense inputs for the office setting for correct reimbursement of the service. The supplies are numerous, for example: site prep supplies, drapes, staff attire, local anesthetic, syringes, needles, scalpels, catheter transfer/extension set, catheter adapter, irrigation, heparin, dressings and non-disposable instruments.

CMS agreed with the stakeholder that the procedure described by 49436 can be safely performed in the nonfacility/office setting. CMS also acknowledged that the PHE for COVID-19 may be constraining access to ASC operating facilities where CPT code 49436 is performed, and if this service were to be done in the nonfacility/office setting, there may well be an ease in the burden to the provider and the patient, when trying to coordinate access with the current PHE ASC restricted schedules. The Agency noted that a nonfacility/office valuation for CPT code 49436, would include the similar supplies, equipment, and clinical labor (if any), that is part of the ASC/Hospital Outpatient

facility's service, plus the payment of the physician's work. The sum of these PEs incurred in the nonfacility/office, will likely be less than current amount paid to the ASC/Hospital Outpatient facility and may result in a net savings when CPT code 49436 is provided in the nonfacility/office setting. After considering the additional information provided by the nominator in combination with the above criteria that a code's site of service may need to change since it was last valued, the agency agreed it may be appropriate to explore establishing a value for code 49436 in the nonfacility/office setting.

We believe that the information provided above, including a request by CMS, meets compelling evidence to price code 49436 in an office setting.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

6. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

n/a

7. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

n/a

8. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

n/a

9. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

n/a

10. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

Clinical staff will facilitate authorization and referral forms; order necessary catheter supplies; obtain interval labs and prior op report; and contact patient regarding any changes to medications/diet prior to the procedure, and need for catheter care supplies at home.
[Note that education will be provided on the day of the procedure]

117	new	peritoneal dialysis catheter transfer set	item	1	An extension tubing that attaches to the PD catheter at the skin level exit site. The transfer set remains in place between PD therapy and is replaced every 6 months or sooner if concerns regarding compromise of the transfer set integrity, post contamination episode or if recurrent/relapsing peritonitis.
118	new	peritoneal dialysis catheter mini-cap for transfer set	item	1	This supply is a plastic disconnect cap for peritoneal dialysis and contains povidone-iodine to protect the female Luer connector of the Baxter transfer set.

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)
NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated after the meeting and resubmitted asap.

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business. In addition, please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Site of Service Anomaly – 2018*

January 2022

Lumbar Laminotomy with Decompression – Tab 17

In October 2018, AMA Staff reviewed services with anomalous sites of service when compared to Medicare utilization data. One service was identified, CPT code 63030 *Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar*, in which the Medicare data from 2014-2017 indicated that it was performed less than 50% of the time in the inpatient setting, yet included inpatient hospital Evaluation and Management services within the global period. The Relativity Assessment Workgroup requested an action plan for January 2019. In January 2019, the RUC recommended that this code be reviewed in two years (January 2021) to determine if the CPT 2017 changes to differentiate percutaneous, endoscopic, and open spine procedures were effective to for correct reporting of this service. In December 2020, the Workgroup noted that CPT code 63030 continues to be primarily reported in the outpatient setting yet still includes inpatient hospital visits. The specialty society indicated that there is still confusion, and 63030 is inappropriately being reported in the outpatient setting. The RUC recommended that CPT code 63030 be referred to the CPT Editorial Panel to revise the descriptor to exclude the types of procedures that are thought to be causing the incorrect reporting in the outpatient setting, such as explicitly stating the types of situations for which CPT code 63030 should not be used. The RUC understood that this service would be surveyed after the CPT revisions and reviewed by the RUC. At the September 2021 CPT meeting, the CPT Editorial Panel did not accept the changes to the descriptors specifying hospitalization as presented by the specialty societies. Since this is a site of service issue, CPT code 63030 was surveyed with the code family for the January 2022 RUC meeting.

Compelling Evidence
The RUC agreed with the specialty societies that flawed methodology was used in the previous valuation of this service. CPT code 63035 is a Harvard-based code and the methodology that Harvard used in developing the work and times was flawed. The Harvard study method for reviewing "secondary codes" (ie, add-on codes) was to survey the primary code as a global code and the add-on code as a multiple of the primary code and then subtract one from the other to determine the additional work related to the secondary code.[1] For example, the data for CPT code 63030 surveyed as a 090-day global code was compared with the data for CPT code 63035 surveyed as a 090-day global code for two levels. The Harvard study used two different panels of neurosurgeons to survey each code resulting in data that did not make sense; some elements of work were lower for 63035 even though a hemilaminectomy of two levels was performed. Further, the difference in total time between the two surveys was 51 minutes, but the final Harvard dataset indicated 49 minutes of intra-service time for 63035. The specialty societies indicated that this was a flawed methodology to determine both the physician time and relative value for 63035, resulting in an underestimation of time and work required, which meets compelling evidence. Secondly, the Harvard study solicited responses only from neurosurgeons (n=17) even though an almost equal number of orthopaedic surgeons perform this service. **The RUC agreed there was compelling evidence that the previous methodology establishing the value for CPT code 63035 was flawed.**

[1] Appendix D4.1 of the Harvard Phase III Final Report

63020 ***Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, cervical***
The RUC reviewed the survey results from 79 neurosurgeons, orthopaedic surgeons and spine surgeons and determined that the survey 25th percentile work RVU of 15.95 appropriately accounts for the physician work required to perform this service. The RUC recommends 40 minutes pre-service evaluation, 20 minutes positioning, 15 minutes scrub/dress/wait time, 90 minutes intra-service time, 30 minutes immediate post-service time, 1-99232, 1-99231, 1-99238, 1-99214 and 2-99213 visits. This service is typically performed in the hospital inpatient setting. The RUC noted that the current physician time for CPT code 63020 was not determined via a typical RUC survey but was based on operative logs and Harvard data which was validated during the 1995 Five-Year Review.

The specialty societies indicated that the first post-operative office visit will typically be level 99214 and includes a discussion with the patient of the preop presentation, review of the operative note and comparison of subjective and objective preop versus postop elements of function. Dressings will be removed. The wound will be assessed and sutures removed. The surgeon will verify the pathology report is consistent with disc material and no other concerning pathology and reassure the patient with that information. Medication management is performed including a prescription drug monitoring program (PDMP) check and to verify use as appropriate with postop instructions and no adverse events. The surgeon will also discuss safely weaning the patient from narcotics and muscle relaxants and discussing how the medication use might impact the patient's ability to work, drive, study, and provide childcare safely. The surgeon will further discuss appropriate use of NSAIDs (prescribed or over the counter (OTC)) and/or other analgesics to switch to as the patient is transitioned from narcotics and muscle relaxants. Orders for changes in medication will be made based on the patient's response to pain experience and medication adverse events. The surgeon will discuss activity guidance, advancing activities, and potential medication-impact on activity. The surgeon will review activity levels and discuss physical and occupation therapy needs and goals, including order therapy. The surgeon will also assess the need for bracing (eg, for foot droop). Shared decision making and assessment of the patient will be required to determine if further imaging or testing is needed, including whether an X-ray should be ordered if there are concerns for iatrogenic instability; whether an MRI should be ordered if there are concerns for incomplete decompression or recurrent herniation of the nucleus pulposus (HNP); and whether a urinalysis and/or post-void residual is needed if there are concerns for urologic dysfunction. Functional needs are assessed that may require coordination with physical medicine and rehabilitation for a debilitated patient. In addition, return to work/school forms will be completed, including guidance on advancing activities toward full return to work/school after review of the patient's view of their work needs in context of their human resource (HR) specified work needs.

The second and third post-operative office visits will typically be level 99213 and include interval update of medical history, physical examination, medication management, PT/OT progress review, order revision, interval imaging as needed, and continued assessment of patient progress watching for recurrent HNP.

The RUC compared the surveyed code to the top key reference service 63047 *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar* (work RVU = 15.37, 90 minutes intra-service time, and 362 minutes total time) and noted that both require similar physician work and the same intra-service time, however 63047 has an appropriately slightly lower work RVU to account for the difference in physician work intensity between lumbar and cervical spine surgery. The RUC noted that 72% of the survey respondents that selected the top key reference code had

indicated that the survey code is more intense and complex. The RUC compared the surveyed code to the second top key reference service 63075 *Discectomy, anterior, with decompression of spinal cord and/or nerve root(s), including osteophytectomy; cervical, single interspace* (work RVU = 19.60, 90 minutes intra-service time and 355 minutes total time). Although codes 63075 and 63020 are both cervical spine operations, code 63075 has a higher work RVU compared with 63020 to appropriately account for the added intensity and complexity of an anterior cervical approach to the spine that includes dissection and protection of the trachea, esophagus and vessels including the carotid.

For additional support, the RUC referenced MPC code 37215 *Transcatheter placement of intravascular stent(s), cervical carotid artery, open or percutaneous, including angioplasty, when performed, and radiological supervision and interpretation; with distal embolic protection* (work RVU = 17.75, 103 minutes intra-service time and 337 minutes total time). **The RUC recommends a work RVU of 15.95 for CPT code 63020.**

63030 ***Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar***

The RUC reviewed the survey results from 90 neurosurgeons, orthopaedic surgeons, and spine surgeons and determined that the current work RVU of 13.18, which is below the survey 25th work RVU, appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes pre-service evaluation, 15 minutes positioning, 15 minutes scrub/dress/wait time, 90 minutes intra-service time, 40 minutes immediate post-service time, 0.5-99238, 1-99214 and 2-99213 visits. The RUC noted that the current pre-service time was established prior to the establishment of pre-time packages and the intra-service and immediate post-service time has not changed.

This service is typically performed in the outpatient hospital setting. However, of the 82% of survey respondents who indicated that they typically perform this service in the hospital, 52% indicated that patients stay overnight (40% less than 24 hours and 12% more than 24 hours) and all respondents indicated a hospital visit occurs. Therefore, a total of 40 minutes post-service time includes the survey median time of 30 minutes plus the intra-time of 10 minutes for current code 99231. Additionally, half a 99238 discharge visit is included even though this patient will not typically be discharged on the same day and complete discharge day management work will be performed on the day after surgery.

The first post-operative office visit will typically be level 99214 and includes a discussion with the patient of the preop presentation, review of the operative note, and comparison of subjective and objective preop versus postop elements of function. Dressings will be removed. The wound will be assessed and sutures removed. The surgeon will verify the pathology report is consistent with disc material and no other concerning pathology and reassure the patient with that information. Medication management is performed including a prescription drug monitoring program (PDMP) check and to verify use as appropriate with postop instructions and no adverse events. The surgeon will also discuss safely weaning the patient from narcotics and muscle relaxants and discuss how the medication use might impact the patient's ability to work, drive, study, and provide childcare safely. The surgeon will further discuss appropriate use of NSAIDs (prescribed or OTC) and/or the use of other analgesics as the patient is transitioned from narcotics and muscle relaxants. Orders for changes in medication will be made based on the patient's response to pain experience and medication adverse events. The surgeon will discuss activity guidance, advancing activities, and potential medication-impact on activity. The surgeon will review activity levels and discuss physical and occupation therapy needs and goals. Shared decision making and assessment of the patient will be required to determine if further imaging or testing is needed, including whether an X-ray should be ordered if there are concerns for iatrogenic instability; whether an MRI should be ordered if there are concerns for incomplete decompression or recurrent

herniation of the nucleus pulposus (HNP); and whether a urinalysis and/or post-void residual is needed if there are concerns for urologic dysfunction. Functional needs are assessed that may require coordination with pain management and rehabilitation (PM&R) for a debilitated patient. In addition, return to work/school forms will be completed, including guidance on advancing activities toward full return to work/school after review of the patient's view of their work needs in context of their HR specified work needs.

The second and third post-operative office visits will typically be level 99213 and include interval update of medical history, physical examination, medication management, PT/OT progress review, order revision, interval imaging as needed, and continued assessment of patient progress watching for recurrent HNP.

The RUC compared the surveyed code to the top key reference service 63047 *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar* (work RVU = 15.37, 90 minutes intra-service time, and 362 minutes total time) and noted that although both services typically involve an identical amount of intra-service time and similar intensity, the reference code involves much more total time as it is typically performed in the inpatient setting. The RUC compared the surveyed code to the second top key reference service 22867 *Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; single level* (work RVU = 15.00, 90 minutes intra-service time, and 271 minutes total time) and noted that code 22867 is more intense and complex than code 63030 due to bilateral decompression as well as placement of an interlaminar/interspinous process stabilization/distraction device and therefore is appropriately valued higher even though it has a somewhat lower total time.

For additional support, the RUC referenced MPC codes 52601 *Transurethral electrosurgical resection of prostate, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, and internal urethrotomy are included)* (work RVU = 13.16 and 75 minutes intra-service time), 53440 *Sling operation for correction of male urinary incontinence (eg, fascia or synthetic)* (work RVU = 13.36 and 90 minutes intra-service time) and 15730 *Midface flap (ie, zygomaticofacial flap) with preservation of vascular pedicle(s)* (work RVU = 13.50 and 90 minutes intra-service time). The RUC concluded that the value of CPT code 63030 should be maintained at 13.18 work RVUs, below the survey 25th percentile. **The RUC recommends a work RVU of 13.18 for CPT code 63030.**

63035 ***Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; each additional interspace, cervical or lumbar (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 81 neurosurgeons, orthopaedic surgeons and spine surgeons and determined that the survey median work RVU of 4.00 appropriately accounts for the work required to perform this service. The RUC recommends 60 minutes intra-service and total time.

The RUC noted that this service was never surveyed via the RUC process and the current value and time is based on the flawed Harvard methodology as indicated in the compelling evidence.

The RUC compared the surveyed code to the top key reference service 63048 *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)* (work RVU = 3.47 and 45 minutes intra-service time) and noted that the surveyed code requires more physician time and work to perform. CPT code 63048 describes the work of extending a laminectomy to an additional level. In 63048, the skin incision is extended either higher or lower, followed by additional fascial incision and dissection of paraspinal muscles to expose the next level of the spine. Radiographic localization is not necessary since the work is routinely performed at an adjacent level. Hence the exposure in 63048 builds off the exposure used for the base code. For CPT code 63035, especially when using a tubular retractor system, the exposure is completed de novo. A new, unique fascial incision is made remotely from the fascial incision (described by the base code), followed by new dissection of paraspinal musculature and new placement of a retractor. For a tubular retractor, new radiographs are required for docking the retractor safely upon the lamina and ensuring appropriate retractor position. The exposure of CPT code 63035 is unique and does not directly build off the exposure of the base code and therefore requires more time and work when compared to CPT code 63048.

The RUC compared the surveyed code to the second top key reference service 22552 *Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots; cervical below C2, each additional interspace (List separately in addition to code for primary procedure)* (work RVU = 6.50 and 45 minutes of intra-service time) and noted that the surveyed service requires less physician work and is less intense.

For additional support, the RUC referenced MPC code 34812 *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)* (work RVU = 4.13 and 40 minutes intra-service time) and CPT code 63621 *Stereotactic radiosurgery (particle beam, gamma ray, or linear accelerator); each additional spinal lesion (List separately in addition to code for primary procedure)* (work RVU = 4.00 and 60 minutes intra-service time). The RUC concluded CPT code 63035 should have a work RVU of 4.00 which appropriately accounts for the work required to perform this service. **The RUC recommends a work RVU of 4.00 for CPT code 63035.**

Practice Expense
The Practice Expense Subcommittee reviewed the direct practice expense inputs and made no modifications to the standard 090-day global inputs. **The RUC recommends the direct practice expense inputs as submitted by the specialty society.**

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
63020 (f)	Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, cervical	090	15.95
63030	Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar	090	13.18 (No Change)
63035 (f)	Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; each additional interspace, cervical or lumbar (List separately in addition to code for primary procedure)	ZZZ	4.00

CPT Descriptor: Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, cervical

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old female presents with intractable left arm pain unresponsive to conservative therapy. Imaging identified a left C5-6 foraminal disc herniation. She undergoes a left C5-6 laminoforaminotomy.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 97% , In the ASC 3%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 19% , Overnight stay-less than 24 hours 26% , Overnight stay-more than 24 hours 55%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 84%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis, as required, are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The patient is reexamined to confirm that physical findings have not changed; the patient's medication regimen has remained the same; the patient has no new allergies; and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The site of the proposed skin incision is marked. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available. Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all imaging equipment. Coordinate antibiotic choice and timing. Transfer of the patient from gurney to operating table, and position the patient prone on an OR table: Prior to the flip, prepare the operating table for the patient's pressure points to the size of the patient, adjust the chest support, the iliac crest support, and support over the proximal part of each thigh. Place any helmet or head fixation device on the patient after anesthesia agrees the patient is ready for it. Gently rotate the patient from the gurney to the prepared operative table, protecting the head and neck. Position and hold the head using a protective helmet, Mayfield skull traction or a horseshoe head holder, secured to the table. The head of the patient is placed in gentle flexion to decrease the cervical lordosis. Flexion is achieved by maintaining the chest pads low on the chest to allow for natural flexion of the neck. Protective pads and restraints are placed, and the table is placed in a reverse Trendelenburg position to help with intraoperative bleeding. Surgical tape is applied to the shoulders and bed to provide traction of the skin and to facilitate imaging of cervical levels. The lower hairline may need to be shaved with an electric razor. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. A lateral cervical radiograph with a metallic marker is taken to confirm the correct operative level, and to mark the final plan for the surgical incision. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team. Standard sterile preparation and draping of the surgical site is completed.

Description of Intra-Service Work: An incision is made adjacent to the spinous process on the side of the abnormality over the operative level. Use lateral fluoroscopy to confirm the level. Release the deep cervical fascia with a knife or Bovie

electrocautery to enable further dissection. Reflect muscular attachments off of the vertebral lamina and medial facet complex. Secure retractors and achieve hemostasis. If using tubular dilators, instead of releasing the deep fascia through an open incision, introduce the initial dilator through the skin incision and advance to the inferomedial edge of the rostral lateral mass at the operative level. Use sequential dilators to create a working portal within the soft tissues. Center the final working tube over the lateral aspect of the lamina and medial facet joint of the appropriate operative level. Secure the working tube to a sterile arm that is attached to the bed. Use lateral fluoroscopy to confirm the level. Complete unilateral laminoforaminotomy using a high-speed burr. Perform the laminoforaminotomy with the use of a high-speed drill and a Kerrison rongeur to create a working window into the foramen. A laminotomy is performed in the caudal lamina can be used to improve visualization of the nerve root. Once the high-speed burr has been used to thin the lamina and the epidural space is accessible, a Kerrison punch is used to continue the osseous resection from medial to lateral. Use a nerve hook to superiorly retract the nerve root, and perform a discectomy and decompression; Use a curet or nerve hook to identify the proximal border of the caudal pedicle. In order to perform a complete foraminal decompression, the nerve must be decompressed fully from the medial to lateral border of the caudal pedicle. Once the top of the pedicle is identified, use a nerve hook to assess the foramen. Use a 1- or 2-mm Kerrison punch to remove bone until the amount of osseous resection and the room available to the nerve are satisfactory After the laminotomy has been completed, a nerve hook can be used to gently retract the nerve root in a cephalad direction to inspect for any disc fragments. Remove any visible, loose disc fragments with a micro-pituitary rongeur. Control bleeding with powdered Gelfoam and bipolar cautery. Copiously irrigate the wound with normal saline solution. Obtain hemostasis with electrocautery or hemostatic foam. Close the wound in layers.

Description of Post-Service Work:
Immediate postoperative care [through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to surgical floor and discuss ongoing care with nursing staff.

Later same day hospital care visit after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Examine patient, check wound(s) and patient progress, and monitor for abnormal neurological findings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

Subsequent hospital care: Each day, review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Examine patient, check wound(s) and patient progress, and monitor for abnormal neurological findings. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

Discharge day management: Review interval nursing/other staff chart notes. Evaluate vital signs and intake/output. Examine patient, check wound(s) and patient progress, and assess neurological findings. Assess pain scores and adequacy of analgesia. Review postdischarge wound care and activity limitations, including planned physical therapy. Answer questions from patient and/or family, nursing, and other provider(s). Write orders for post-discharge films, medications, and therapy. Chart patient discharge notes.

Office: Examine patient and perform periodic neurological exams. Write orders for medications. Order and review follow-up films. Monitor wounds and remove staples, when appropriate. Assess pain scores and adequacy of analgesia. Check PMP registry and discuss decreasing or discontinuing opioid medications, muscle relaxants, and other analgesic management. Discuss advancing activities, including return to work/school, provide appropriate documentation when needed for return to work/school; discuss safe return to driving when appropriate. Review physical therapy progress and revise orders as needed. Dictate patient progress notes for medical chart. Answer questions from patient and/or family, and insurance staff. Discuss (oral and written) patient progress with referring physician.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	3%	25%	66%	6%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	50%	47%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	34%	66%
Physical effort required	3%	47%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	38%	63%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	54%	38%	8%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	79%	21%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	50%	50%
Physical effort required	13%	46%	42%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	58%	42%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In October 2018, AMA Staff reviewed services with anomalous sites of service when compared to Medicare utilization data. Code 63030 was identified with Medicare data from 2014-2017e indicated that it was performed less than 50% of the time with inpatient status, yet included inpatient hospital Evaluation and Management services within the global period. In January 2019, the RUC reviewed an action plan and recommended that code 63030 be reviewed in two years (January 2021) to determine if the CPT 2017 changes were effective to ensure correct reporting of this service. In December 2020, the RAW noted that 63030 continued to have outpatient status more than 50% of the time. The specialty society indicated that there was still coding confusion and the RUC recommended that CPT code 63030 be referred to CPT to revise the descriptor to exclude the types of procedures that are thought to be causing the incorrect reporting in the outpatient setting, such as explicitly stating the types of situations for which CPT code 63030 should not be used. The CPT code change application to differentiate inpatient (63030) versus outpatient (630X0) was rejected by the CPT Panel. In rejection the application, the Panel noted that the proposed descriptor changes "were not unique, well-defined, and described a procedure or service which is clearly identified and distinguished from existing procedures and services already in CPT." This resulted in code 63030 (lumbar) reverting back to the RUC for survey. The societies added code 63020 (cervical) and +63035 (additional level) as family codes for review.

Recommendation - 63020

We recommend the survey 25th percentile work RVU of 15.95. Using magnitude estimation, a value of 15.95 accounts for both the decrease in intraoperative time and increase in postoperative work. This value also compares well with the key reference code 63047 which has slight less total time, but the same intensity.

Pre-time Package 4

Evaluation time: Standard package time of 40 minutes which is less than the survey median.

Positioning time: The survey median time of 20 minutes is recommended. This is less than the time allowed for supine positioning followed by prone positioning for posterior neck surgery package SS2.

Scrub, dress, wait time: The survey median time of 15 minutes is recommended which is less than package 4 time.

Post-time Package 9B

The survey median time of 30 minutes is recommended.

Postop Office Visits

The first visit will typically be level 99214 and includes a discussion with the patient of the preop presentation, review of the operative note and comparison of subjective and objective preop versus postop elements of function. Dressings will be removed, the wound will be assessed and sutures removed. The surgeon will verify the pathology report is consistent with disc material and no other concerning pathology, and reassure the patient with that information. Medication management is performed including a PDMP check and to verify use as appropriate with postop instructions and no adverse events. The surgeon will also discuss safely weaning the patient from narcotics and muscle relaxants, and discussing how the medication use might impact the patient's ability to work, drive, study, provide child care safely. The surgeon will further discuss appropriate use of NSAIDs (prescribed or OTC) and/or other analgesics to switch to as the patient is transitioned from narcotics and muscle relaxants. Orders for changes in medication will be made based on the patient's response to pain experience and medication adverse events. The surgeon will discuss activity guidance, advancing activities, and potential medication-impact on activity. The surgeon will review activity levels and discuss physical and occupation therapy needs and goals, including order therapy. The surgeon will also assess the need for bracing (eg, for foot droop). Shared decision making and assessment of the patient will be required to determine if further imaging or testing is needed, including whether an X-ray should be ordered if there are concerns for iatrogenic instability; whether an MRI should be ordered if there are concerns for incomplete decompression or recurrent HNP; and whether a UA and/or post-void residual is needed if there are concerns for urologic dysfunction. Functional needs are assessed that may require coordination with PM&R for a debilitated patient. In addition, return to work/school forms will be completed, including guidance on advancing activities toward full return to work/school after review of the patient's view of their work needs in context of their HR specified work needs.

The second and third visit will typically be level 99213 and include interval update of H&P, medication management, PT/OT progress review and order revision, interval imaging order as needed, and continued assessment of patient progress watching for recurrent HNP.

Key Reference Codes

KRS1 code 63047 is similar to 63020, but appropriately has a slightly lower RVW to account for the difference between lumbar and cervical spine surgery. Although KRS2 code 63075 and 63020 are both cervical spine operations, code 63075 has a higher RVW compared with 63020 to appropriately account for the added intensity and complexity of an anterior cervical approach to the spine that includes dissection and protection of the trachea, esophagus and vessels including the carotid.

CPT	DESCRIPTOR	Glob	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 63020

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Sometimes

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Explor/Decompr/Excis disc

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 63020

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:63030 Tracking Number Original Specialty Recommended RVU: **13.18**
Presented Recommended RVU: **13.18**
Global Period: 090 Current Work RVU: **13.18** RUC Recommended RVU: **13.18**

CPT Descriptor: Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male presents with a 6-week history of progressive right leg pain unresponsive to conservative therapy. Imaging identified a right L5-S1 paracentral disc herniation resulting in right lateral recess stenosis. He undergoes a right L5-S1 discectomy.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 82% , In the ASC 18%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 48% , Overnight stay-less than 24 hours 40% , Overnight stay-more than 24 hours 12%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 86%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis, as required, are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The patient is reexamined to confirm that physical findings have not changed; the patient's medication regimen has remained the same; the patient has no new allergies; and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The site of the proposed skin incision is marked. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available. Transfer of the patient from gurney to operating table, and position the patient prone on an OR table: Prior to the flip, prepare the operating table for the patient's pressure points to the size of the patient, adjust the chest support, the iliac crest support, and support over the proximal part of each thigh. Protective pads and restraints are placed, and the table is placed in a reverse Trendelenburg position to help with intraoperative bleeding. Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all imaging equipment. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. A lateral radiograph with a metallic marker is taken to confirm the correct operative level and to mark the final plan for the surgical incision. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team. Standard sterile preparation and draping of the surgical site is completed.

Description of Intra-Service Work: An incision is made adjacent to the spinous process on the side of the abnormality over the operative level. Use lateral fluoroscopy to confirm the level. Release the deep lumbar fascia with a knife or Bovie electrocautery Reflect muscular attachments off of the vertebral lamina and medial facet complex. Secure retractors and achieve hemostasis. If using tubular dilators, instead of releasing the deep fascia through an open incision, introduce the initial dilator through the skin incision and advance to the inferomedial edge of the rostral lamina at the operative level. Use sequential dilators to create a working portal within the soft tissues. Center the final working tube over the lateral aspect of the lamina and medial facet joint of the appropriate operative level. Secure the working tube to a sterile arm that is attached to the bed. Perform the laminoforaminotomy with the use of a high-speed drill and a Kerrison rongeur to create a working

window into the foramen. Once the high-speed burr has been used to thin the lamina and the epidural space is accessible, a Kerrison punch is used to continue the osseous resection from medial to lateral. Address epidural bleeding. Use a nerve hook or Penfield 4 to dissect and retract the nerve root. Secure the traversing nerve root with a nerve root retractor. Perform a discectomy and decompression. Remove any evident free fragments of disc. Incise annulus of disc, remove any visible, loose disc fragments with a micro-pituitary rongeur. Contained disc fragments require incision of the posterior longitudinal ligament. Control bleeding with powdered Gelfoam and bipolar cautery. Copiously irrigate the wound with normal saline solution. Obtain hemostasis with electrocautery or hemostatic foam. Close the wound in layers.

Description of Post-Service Work:
Immediate postoperative care [through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to surgical floor and discuss ongoing care with nursing staff.

Later same day hospital care visit after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Examine patient, check wound(s) and patient progress, and monitor for abnormal neurological findings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

Next day subsequent hospital care and discharge management Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Examine patient, check wound(s) and patient progress, and monitor for abnormal neurological findings. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. When it is safe to discharge the patient, review postdischarge wound care and activity limitations, including planned physical therapy. Answer questions from patient and/or family, nursing, and other provider(s). Write orders for post-discharge films, medications, and therapy. Chart patient discharge notes.

Office: Examine patient and perform periodic neurological exams. Write orders for medications. Order and review follow-up films. Monitor wounds and remove staples, when appropriate. Assess pain scores and adequacy of analgesia. Check PMP registry and discuss decreasing or discontinuing opioid medications, muscle relaxants, and other analgesic management. Discuss advancing activities, including return to work/school, provide appropriate documentation when needed for return to work/school; discuss safe return to driving when appropriate. Review physical therapy progress and revise orders as needed. Dictate patient progress notes for medical chart. Answer questions from patient and/or family, and insurance staff. Discuss (oral and written) patient progress with referring physician.

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	14%	86%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In October 2018, AMA Staff reviewed services with anomalous sites of service when compared to Medicare utilization data. Code 63030 was identified with Medicare data from 2014-2017e indicated that it was performed less than 50% of the time with inpatient status, yet included inpatient hospital Evaluation and Management services within the global period. In January 2019, the RUC reviewed an action plan and recommended that code 63030 be reviewed in two years (January 2021) to determine if the CPT 2017 changes were effective to ensure correct reporting of this service. In December 2020, the RAW noted that 63030 continued to have outpatient status more than 50% of the time. The specialty society indicated that there was still coding confusion and the RUC recommended that CPT code 63030 be referred to CPT to revise the descriptor to exclude the types of procedures that are thought to be causing the incorrect reporting in the outpatient setting, such as explicitly stating the types of situations for which CPT code 63030 should not be used. The CPT code change application to differentiate inpatient (63030) versus outpatient (630X0) was rejected by the CPT Panel. In rejection the application, the Panel noted that the proposed descriptor changes "were not unique, well-defined, and described a procedure or service which is clearly identified and distinguished from existing procedures and services already in CPT." This resulted in code 63030 (lumbar) reverting back to the RUC for survey. The societies added code 63020 (cervical) and +63035 (additional level) as family codes for review.

Important additional discussion about postoperative facility work

Many years ago, the RUC developed a policy for work and time inputs for codes where a patient went home the same day after a procedure and there was overlap in immediate post-work/time and later same day discharge work/time. The resolution by the RUC, with concurrence by CMS when proposed, was to indicate one-half discharge code (0.5 x99238) as a proxy for overlapping work on the same date. In fact, to accurately determine this, the RUC developed a new survey question to differentiate between same day discharge and next day discharge. The 0.5 x 99238 proxy initially was only applied to same day services. This reduction in discharge work was similar to E/M codes established for same day admit and discharge, where discharge did not get full value. On the other hand, a full discharge service code was allowed in global codes if the patient stayed one or more midnights, similar to E/M codes established for a facility visit on day 1 and a full discharge code on a subsequent date.

The facility status (observation versus inpatient) for patients who are placed in a hospital bed on a surgical floor postoperatively and stay overnight has been extensively discussed for more than 10 years. The early years of this discussion led to the "two-midnight rule." Unfortunately, CMS mixed facility status with physician work in developing a 23-hour outpatient stay policy about what E/M codes can and cannot be associated with a global code by assuming all claims with an outpatient facility status should be treated the same in terms of physician work independent of whether the work was performed on the same day as a procedure or the next day.

Surgical societies responded to the 23-hour outpatient stay policy when proposed by indicating that a patient can be admitted as inpatient and discharged the next day and maintain inpatient status if all the requirements for assignment of status were met in newly developed programs such as InterQual which are based on criteria of facility resource utilization. For example, if a patient came into the hospital with a diagnosis of acute renal failure with a creatinine of 6, used a vein light for IV access and was placed on IV fluids at 75cc/hour, the patient would not qualify for inpatient status. However, if the fluids ran at 100cc/hour or greater, the same patient would qualify for inpatient status. The physician work to order 75cc/hr versus 100cc/hr of fluids may not be different, but the resources used by the facility would be different and result in different payments to the facility. All of this is to say that physician work is judged by MDM or time and not by facility resources used.

In 2023, the inpatient versus observation (outpatient) reporting paradigm will change since there will be a single code to report on the date of admission and a single code to report on the subsequent discharge day that is independent of whether the patient's facility status is inpatient or observation. The establishment of a single combined inpatient/observation E/M code for each level of physician work is consistent with what surgeons have been saying since 2007 – an E/M visit for a patient in a hospital bed on the surgical floor is not dependent on the final facility status for the patient, but instead on the MDM (or total time) required. Any difference in patient acuity would result in more or less medical decision making and/or time and be reported appropriately.

In fact, at the October 2021 RUC meeting, the Research Subcommittee and the RUC agreed that postoperative physician E/M work should accurately be accounted for in global codes:

The Research Subcommittee recommends for the RUC Chair and the AMA to meet to advocate for CMS to change its policy for discharge day visits in the surgical global period, where the ½ day discharge proxy would only be applicable to services that typically involve a same-day discharge. Similarly, the Research Subcommittee recommends for the RUC Chair and the AMA to meet to advocate for CMS to eliminate its 23-hour stay policy of allocating the intra-service portion of the typically performed subsequent hospital visit to the immediate post-service time of an outpatient

procedure. The Research Subcommittee also recommends for an update on this meeting to be provided to the RUC after it takes place.**[Approved]**

All of the discussion above is meant to emphasize that reason needs to prevail in the discussion about accounting for "perceived" changes in physician work for patients who are not ambulatory and do not leave a hospital on the day of a procedure, but instead are admitted to the surgical ward, and—if medically able and appropriate—leave the next day. Although we will follow the 23-hour policy for code 63030 in this agenda tab, we emphasize that in 2023, there will no longer be different codes for hospital inpatient or observation care services and that movement of time and reduction of claims to "0.5" is counter to the RUC recommendation made at the October 2021 meeting .

Recommendation - 63030

We recommend maintaining the current work RVU of 13.18. Using magnitude estimation, a value of 13.18 accounts for both the decrease in postoperative facility work and increase in postoperative office work. As presented in the "Important additional discussion about postoperative facility work" above, we believe (and the RUC agrees) that full work should be accounted for in global codes. An E/M facility visit should not be decreased for surgical postop work in global codes and discharge day management work on the day after surgery. This is not less work than for medical patient on the day of and after admission for observation (ie, surgeons should not get credit for 0.5 x 99238 while physicians caring for medical patients are allowed to report 1.0 x 99238 for the same work). If the arbitrary discounting of global code E/M work was not implemented, the total time per the survey would be the same as current time, with only a shift of work from facility to office. Fundamentally, the total work for 63030 has not changed.

Pre-time Package 4

Evaluation time: Standard package time of 40 minutes which is less than the survey median.

Positioning time: The survey median time of 15 minutes is recommended. This is less than the time allowed for supine positioning followed by prone positioning for posterior thoracic/lumbar surgery package SS3.

Scrub, dress, wait time: The survey median time of 15 minutes is recommended which is less than package 4 time.

Post-time

A total of 40 minutes is shown which includes the survey median time of 30 minutes plus the intra-time of 10 minutes for current code 99231 per the CMS 23-hour outpatient policy—keeping in mind that in 2023, code 99231 will be revised to reflect both inpatient and observation (outpatient) E/M work. Additionally, 99238 has been shown as 0.5 x 99238 even though this patient will not typically be discharge on the same day and complete discharge day management work will be performed on the day after surgery.

Postop Office Visits

The first visit will typically be level 99214 and includes a discussion with the patient of the preop presentation, review of the operative note and comparison of subjective and objective preop versus postop elements of function. Dressings will be removed, the wound will be assessed and sutures removed. The surgeon will verify the pathology report is consistent with disc material and no other concerning pathology, and reassure the patient with that information. Medication management is performed including a PDMP check and to verify use as appropriate with postop instructions and no adverse events. The surgeon will also discuss safely weaning the patient from narcotics and muscle relaxants, and discussing how the medication use might impact the patient's ability to work, drive, study, provide child care safely. The surgeon will further discuss appropriate use of NSAIDs (prescribed or OTC) and/or other analgesics to switch to as the patient is transitioned from narcotics and muscle relaxants. Orders for changes in medication will be made based on the patient's response to pain experience and medication adverse events. The surgeon will discuss activity guidance, advancing activities, and potential medication-impact on activity. The surgeon will review activity levels and discuss physical and occupation therapy needs and goals, including order therapy. Shared decision making and assessment of the patient will be required to determine if further imaging or testing is needed, including whether an X-ray should be ordered if there are concerns for iatrogenic instability; whether an MRI should be ordered if there are concerns for incomplete decompression or recurrent HNP; and whether a UA and/or post-void residual is needed if there are concerns for urologic dysfunction. Functional needs are assessed that may require coordination with PM&R for a debilitated patient. In addition, return to work/school forms will be completed, including guidance on advancing activities toward full return to work/school after review of the patient's view of their work needs in context of their HR specified work needs.

The second and third visit will typically be level 99213 and include interval update of H&P, medication management, PT/OT progress review and order revision, interval imaging order as needed, and continued assessment of patient progress watching for recurrent HNP.

Key Reference Codes

KRS1 code 63047 is similar to 63020, but appropriately has a higher RVW to account for additional postop work. KRS2 code 22867 is more intense and complex than 63030 due to bilateral decompression as well as placement of an interlaminar/interspinous process stabilization/distraction device and therefore is appropriately valued higher.

CPT	DESCRIPTOR	Glob	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
63030	Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar	090	13.18	0.076	305	70	90	140
22867	Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; single level	090	15.00	0.106	276	68	90	118
63047	Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar	090	15.37	0.077	362	75	90	197

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 63030

CPT Descriptor: Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; each additional interspace, cervical or lumbar (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: After performing a L5-S1 discectomy (separately reported) on a 50-year-old male with a 6-week history of progressive right leg pain unresponsive to conservative therapy and imaging studies that identified right-sided disc herniations at two levels, an additional level right L4-5 discectomy is performed. Note: This is an add-on service which only includes the work of the additional level discectomy.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The incision is extended as necessary to facilitate exposure of the spinous process on the side of the abnormality over the next operative level. Use lateral fluoroscopy to confirm the level. Release the deep lumbar fascia with a knife or Bovie electrocautery Reflect muscular attachments off of the vertebral lamina and medial facet complex. Secure retractors and achieve hemostasis. If using tubular dilators, complete a second cycle of introducing and docking the tubular dilator over the involved disc space. Instead of releasing the deep fascia through an open incision, introduce the initial dilator through the skin incision and advance to the inferomedial edge of the rostral lamina at the operative level. Use sequential dilators to create a working portal within the soft tissues. Center the final working tube over the lateral aspect of the lamina and medial facet joint of the appropriate operative level. Secure the working tube to a sterile arm that is attached to the bed. Use lateral fluoroscopy to confirm the new level. Perform the laminoforaminotomy with the use of a high-speed drill and a Kerrison rongeur to create a working window into the foramen. Once the high-speed burr has been used to thin the lamina and the epidural space is accessible, a Kerrison punch is used to continue the osseous resection from medial to lateral. Address epidural bleeding. Use a nerve hook or Penfield 4 to dissect and retract the nerve root. Secure the traversing nerve root with a nerve root retractor. Perform a discectomy and decompression. Remove any evident free fragments of disc. Incise annulus of disc, remove any visible, loose disc fragments with a micro-pituitary rongeur. Contained disc fragments require incision of the posterior longitudinal ligament. Control bleeding with powdered Gelfoam and bipolar cautery. Copiously irrigate the wound with normal saline solution. Obtain hemostasis with electrocautery or hemostatic foam. The wound extension is closed in layers.

Description of Post-Service Work: N/A

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	7%	69%	24%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	10%	64%	25%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	3%	66%	31%
Physical effort required	7%	73%	20%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	3%	69%	27%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	29%	71%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	100%	0%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	71%	29%
Physical effort required	0%	57%	43%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	71%	29%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In October 2018, AMA Staff reviewed services with anomalous sites of service when compared to Medicare utilization data. Code 63030 was identified with Medicare data from 2014-2017e indicated that it was performed less than 50% of the time with inpatient status, yet included inpatient hospital Evaluation and Management services within the global period. In January 2019, the RUC reviewed an action plan and recommended that code 63030 be reviewed in two years (January 2021) to determine if the CPT 2017 changes were effective to ensure correct reporting of this service. In December 2020, the RAW noted that 63030 continued to have outpatient status more than 50% of the time. The specialty society indicated that there was still coding confusion and the RUC recommended that CPT code 63030 be referred to CPT to revise the descriptor to exclude the types of procedures that are thought to be causing the incorrect reporting in the outpatient setting, such as explicitly stating the types of situations for which CPT code 63030 should not be used. The CPT code change application to differentiate inpatient (63030) versus outpatient (630X0) was rejected by the CPT Panel. In rejection the application, the Panel noted that the proposed descriptor changes "were not unique, well-defined, and described a procedure or service which is clearly identified and distinguished from existing procedures and services already in CPT." This resulted in code 63030 (lumbar) reverting back to the RUC for survey. The societies added code 63020 (cervical) and +63035 (additional level) as family codes for review.

Compelling Evidence - flawed mechanism or methodology used in the previous valuation

1. Code 63035 is a Harvard-based code. The Harvard study method for reviewing "secondary codes" (ie, add-on codes) was to survey the primary code as a global code and the add-on code as a multiple of the primary code and then subtract one from the other to determine the additional work related to the secondary code.[1] So, for example, the data for code 63030 surveyed as a 90-day global code was compared with the data for code 63035 surveyed as a 90-day global code for 2 levels. Although this sounds like a good idea, the Harvard study used two different panels of neurosurgeons to survey each code resulting in data that did not make sense; some elements of work were lower for 63035even though a hemilaminectomy of 2 levels was performed. Further, the difference in total time between the two surveys was 51 minutes, but the final Harvard dataset indicated 49 minutes of intra-time for 63035. We believe this was a flaw methodology to determine both an absolute and relative value for 63035, resulting in an underestimation of time and work required, which meets compelling evidence.

2. The Harvard study solicited responses only from neurosurgeons (n=17) even though an almost equal number of orthopaedic surgeons perform this service. This also meets compelling evidence.

Recommendation - 63035

We recommend the survey median work RVU of 4.00.

Key Reference Codes

Code 63035 requires more time than KRS1 63048, supporting a higher value for 63035 and justifying the median survey value for this code. Code 63048 describes the work of extending a laminectomy to an additional level. In 63048, the skin incision is extended either higher or lower, followed by additional fascial incision and dissection of paraspinal muscles to expose the next level of the spine. Radiographic localization is not necessary, since the work is routinely performed at an adjacent level. Hence the exposure in 63048 builds off of the exposure used for the base code. For 63035, especially when using a tubular retractor system, the exposure is completed de novo. A new, unique fascial incision is made remotely from the base code fascial incision, followed by new dissection of paraspinal musculature and new placement of a retractor. For a tubular retractor, new radiographs are required for docking the retractor safely upon the lamina and ensuring appropriate retractor position. The exposure of 63035 is unique and does not directly build of the exposure of the base code and therefore requires more time and work when compared to 63048.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 63035 in conjunction with 63020-63030)

CPT Code	Long Descriptor	Global Period
63020	Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, cervical	90
63030	Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar	90
63035	Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; each additional interspace, cervical or lumbar (List separately in addition to code for primary procedure)	ZZZ

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
63020	A 45-year-old female presents with intractable left arm pain unresponsive to conservative therapy. Imaging identified a left C5-6 foraminal disc herniation. She undergoes a left C5-6 laminoforaminotomy.
63030	A 50-year-old male presents with a 6-week history of progressive right leg pain unresponsive to conservative therapy. Imaging identified a right L5-S1 paracentral disc herniation resulting in right lateral recess stenosis. He undergoes a right L5-S1 discectomy.
63035	After performing a L5-S1 discectomy (separately reported) on a 50-year-old male with a 6-week history of progressive right leg pain unresponsive to conservative therapy and imaging studies that identified right-sided disc herniations at two levels, an additional level right L4-5 discectomy is performed. Note: This is an add-on service which only includes the work of the additional level discectomy.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The society advisors reviewed the current PE inputs for these facility only codes.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (NOTE: *For services reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

   current codes

3. Is this code(s) typically reported with an E/M service?

   no

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

4. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence. (Please see *PE compelling evidence guidelines* on Collaboration). Please explain if the increase can be entirely accounted for because of an increase in physician time:

Increase in cost is due to increases in clinical labor rate, increased postop visit level; and addition of exam light for postop visits. The exam light is needed to assess the wound and remove staples and is a standard piece of equipment in a neurosurgeon and orthopaedic exam room.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require either minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

no

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

na

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

na

8. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

Activity	Clinical Staff Work	TIME
Complete pre-service diagnostic and referral forms	Staff reviews all forms with patient and family to ensure all relevant history and diagnostic information is included.	5
Coordinate pre-surgery services (including test results)	Staff coordinates collection and documentation of imaging/lab results, patient specific information and other relevant patient information for surgical procedure including conducting requisite pre-surgery assessment with anesthesiologist. Enter and record all clinical updates in EHR.	20
Schedule space and equipment in facility	Staff interacts with facility to schedule space, supplies, equipment, and review checklists.	8
Provide pre-service education/obtain consent	Staff reviews procedure, complication risk, process of recovery, and answers patient/family questions.	20

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Complete pre-procedure phone calls and prescription	Staff reviews preoperative medication changes, preop diet restrictions, reviews patient medical status and answers final pre-admission questions.	7

b. Service period (includes pre, intra and post):

Prior to discharge, office clinical staff will assist with necessary post-discharge care coordination, such as: Responding to patient/family questions about home activity restrictions. Confirmation of discharge antibiotics if needed, and pain medication. Coordination with other physicians and QHPs involved in the care of the patient for transfer of records. Transitioning discharge information to the surgeon's office medical record, including medication list, correspondence and imaging or lab results pending at discharge.

c. Post-service period:

The clinical staff work includes the standard activities involved in any E/M visit including ensuring the appropriate supplies are available in the room, ensuring imaging and lab reports are available, rooming the patient, gowning, reviewing current medications/allergies in EHR, obtaining vital signs, assisting with positioning, wound care, coordination of care, and cleaning of the room.

9. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet*):

na

10. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.
